MiTek[®]
Better Technology. Better Building.[™]

Integrated Solutions for Optimized Structures

MiTek Builder Products, a division of MiTek, USA, combines three previously independent companies: **USP Structural Connectors®**, **Hardy Frame®** **Shear Wall System**, and **Z4™ Continuous Tie-Down System**. Aligned in its purpose, our combined team serves the construction industry with a full range of structural and design solutions for a more efficient construction process and optimized structures.

The **USP Structural Connectors** brand offers a comprehensive line of code-evaluated connectors, framing hardware, fasteners, anchors and epoxy solutions for the residential, commercial and DIY markets. Our structural products are supported by a

nationwide team of knowledgeable engineering, sales and customer service professionals who are complemented by leading edge specification, design and modeling software.

Our single goal: to serve you seamlessly with industry-leading technological innovation, products and support with a passionate commitment to your success. It's how we deliver Better Technology. Better Building.SM

To connect with all of the MiTek Builder Products visit **www.MiTekBuilderProducts.com**.

MiTek®
BUILDER PRODUCTS

USP CATALOG IPAD APP

Browse our entire connector product line on your Apple iPad. The free USP Catalog app includes product and application illustrations, installation instructions, fastening schedules and load ratings.

USPConnectors.com/resources/ipad-app

Our diverse software applications help you find the right connection solutions to all your structural needs.

SAPPHIRE™ Supply

Whole house design software tailored to the lumber dealers EWP design and estimating operations.

Sapphire Supply is available exclusively to USP stocking dealers. **MiTek-us.com/SAPPHIRE**

USP Specifier™

Free software for specification, conversion and project estimating simplifies access to information and documentation on over 3,000 USP structural connectors through an intuitive and graphical desktop interface.

USPConnectors.com/resources/usp-specifier

USP Deck Designer™

Free online interactive software program that will help you and your clients design the deck of their dreams. Easy to use, visualize and collaborate.

2015 NEW PRODUCTS

Fasteners

HDG Hex Head Wood Screws

USP's WS Structural Wood Screws in Hot-Dip Galvanized finish are designed for installation with our Triple-Zinc G-185 and hot-dip galvanized connector products as well as wood-to-wood installations. They are recommended for outdoor applications and with treated wood.

See [Page 20](#) for more information.

Concrete & Masonry

Adhesive Anchoring Systems

A complete line of high performance epoxy for heavy industrial seismic and wind applications to household projects.

See [Pages 25-26](#) for more information.

FA4 Foundation Anchor

The FA4 foundation anchors can be installed as a replacement for anchor bolts while achieving the same load capacity. They can also be used to replace 1/2" diameter anchor bolts.

See [Page 37](#) for more information.

Adj. Steel Column Products

T2JPM Adjustable Support Columns

Medium-Duty Type 2 Support Columns are an intermediate offering to our Type 2 Heavy Duty Adjustable Support Columns series. Available in (8) sizes in adjustable heights from 80" to 120". Tested to meet or exceed the CAN/CGSB-7.2-94 Adjustable Steel Columns Standard.

See [Page 43](#) for more information.

Holdowns

HTT45 Tension Ties

The newest addition to our line of Tension Ties is the HTT45 which provides an increased load carrying capacity by utilizing the diamond hole nailing pattern. Easily installs with 10d or 16d nails. The 16d Max nailing can be used when lower deflections are required by design.

See [Page 48](#) for more information.

Angles & Straps

JA Joist Anchor

The JA Joist Anchor is designed to laterally connect a joist to a concrete wall. The anchor is embedded into the wall at one end and nailed to the joist at the strap end, typically used where there is a fire separation wall such as in town houses.

See [Page 92](#) for more information.

Hangers

FWH Fire Wall Hangers

The FWH Fire Wall Hanger series is the best solution for attaching floor framing to fire rated walls in wood frame construction. The advanced design allows the installation of the FWH before the drywall is attached and permits the building project to be completely framed-up, and weather-tight before the drywall sheathing work starts.

See [Pages 109-110](#) for more information.

EWP Hangers

THFI Face Mount I-Joist Hangers

The THFI is a face mount hanger designed to attach EWP I-Joist members to wood headers. The unique design of the THFI combines the installation ease of a top mount hanger with the installation flexibility of a face mount hanger. The side flanges extend to the top chord of the I-Joist so web stiffeners are not required. The THFI hangers also feature strategically placed Seat Cleats® which lock the bottom flange of the I-joist to the hanger eliminating the need for joist nails to be installed.

See [Pages 128 and 133](#) for more information.

HBPH Top Mount Hangers

HBPH Top Mount Hangers are designed to support LVL, LSL and PSL beams and purlins in heavy capacity load conditions.

See [Pages 138, 145-154](#) for more information.

Plated Truss

MSHA Adjustable Strap Skewed Hangers

The MSHA Series hanger offers the most flexible field solution for truss-to-truss connections accommodating a range of skews and challenging web-chord geometry often found in truss framing. Eliminating the need for special order hangers, the MSHA Series provides economical solutions for 2x and 4x trusses skewed between 22½° to 75° and can be used in top mount, face mount or combination installation.

See [Pages 180-181](#) for more information.

THDHQ Girder Truss Hangers

The THDHQ hangers are designed to attach multi-ply girder trusses together using USP's WS Wood Screws for high load capacity. THDHQ hangers can also be used to attach structural composite lumber (SCL) to other framing members.

See [Page 176](#) for more information.

WARRANTY

MiTek USA, Inc. ("MiTek") warrants its USP catalog Products to be free from material defects in manufacture and design, and further warrants that they will perform within the design limitations of its published building code approvals for the applications described, when properly installed and maintained. These warranties do not cover Product deterioration due to environmental conditions, Products that have been modified or damaged, improperly installed or used outside of published design limitations or for other applications. In the event any Product is shown to not conform to these warranties, USP's sole obligation, and Customer's sole and exclusive remedy, shall be, at USP's option, to replace the non-conforming product or refund the full purchase price paid by Customer to USP therefor. USP MAKES NO OTHER PRODUCT WARRANTIES, EXPRESS OR IMPLIED, OF ANY KIND, AND

PARTICULARLY EXCLUDES ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. IN NO EVENT SHALL USP BE LIABLE FOR INCIDENTAL, CONSEQUENTIAL OR SPECIAL DAMAGES, REGARDLESS OF THE LEGAL THEORY OF RECOVERY, EVEN IF IT WAS AWARE OF THE POSSIBILITY OF SUCH DAMAGES. IN ANY CASE, USP'S MAXIMUM LIABILITY SHALL NOT EXCEED THE PURCHASE PRICE PAID BY CUSTOMER FOR THE NON-CONFORMING PRODUCT. Some states restrict consequential or other liability damage limitations, so some of the above limitations may not apply to you. MiTek reserves the right to change this warranty periodically. Consult MiTek's website www.uspconnectors.com or contact MiTek for a current warranty statement.

Reference Number Index

About the Reference Numbers

Reference numbers shown throughout the charts in this catalog are part numbers which may be more familiar to customers in various regions. These are included for the convenience of our new customers who have recently switched from a competitor's product line to USP.

The reference numbers in this catalog are for general application comparison only and should not be used as a substitution tool. The user is responsible to compare specific load values, fastener schedules, material specifications, and other factors to determine suitability of use for any particular product.

For the majority of applications, metal hangers and connectors are used in interior, above ground, dry service conditions. They are typically not being exposed to corrosive environments which can significantly reduce their strength and longevity.

What is Corrosion?

Corrosion is the destructive degradation of steel due to its interaction with the environment. Here the steel is the connector and the environment is whatever the connector interacts with, namely wood and air. Each environment may contain one or more corrodents (substances that cause corrosion) acting independently or in combination to degrade the strength of the connectors.

Electrochemical oxidation is the most common type of corrosion affecting metal connectors. It is a process in which iron (Fe) reacts with oxygen (O_2) in the presence of an electrolyte such as water (H_2O) to form iron oxide (Fe_2O_3), a brown and flaky by-product commonly known as rust.

Steel is an iron-based metal alloy which is susceptible to this type of corrosion, even when exposed to normal atmospheric air, since air contains oxygen and water as part of its normal composition. While steel is very strong, rust is not. Over time, the continuous formation of rust eats away the base metal and reduces the strength of the connector. The rate of oxidation generally increases with increasing moisture content, the presence of salt, or when galvanic corrosion is a contributing factor.

Galvanic Series (Abbreviated)	
More Active (Anodic-)	
	Zinc
	Aluminum
	Steel
	Brass
	Copper Nickel
	Stainless Steel - Type 304
	Stainless Steel - Type 316
More Passive (Cathodic +)	

Galvanic corrosion occurs when there is an interaction between dissimilar metals that are in contact with one another. The degree of corrosion depends on where the metals reside in the galvanic series, which is a compilation of known metals and their relative reactivity. The more active metal (anode) will corrode preferentially while shielding the more

passive metal (cathode) from further degradation. For example, with galvanized steel, zinc is used as a coating on the steel because it sacrificially corrodes to protect the steel substrate underneath. The coupling between zinc and steel is said to have a lower galvanic potential than the coupling between zinc and stainless steel because zinc and steel are closer to each other in the galvanic series. In general, the coupling with a lower galvanic potential would result in a slower corrosion rate.

Corrosion Protection Options

Zinc Galvanizing:

Most connectors are manufactured from pre-galvanized sheet steel or coiled steel, which is typically made by the hot-dip process in accordance with ASTM-A653 and ASTM-A924 standards. Fasteners are galvanized in accordance with ASTM-A153. In the manufacturing of the connectors, the punching and shearing processes create exposed bare metal surfaces. Thankfully, zinc has an incredible ability to 'heal' itself; the zinc around the exposed metal corrodes and deposits a layer of zinc corrosion by-product called zinc patina (white powdery appearance) over the exposed metal to further protect it.

By being more reactive than steel, zinc sacrificially corrodes at a steady rate over time to shield the steel from the effect of corrosion. The protection ability of zinc is proportional to its thickness, which is proportional to the amount of zinc applied. Zinc coating is specified as the total weight on both sides of the sheet steel, measured in ounces per square foot (oz/ft²). For example, G90 means that there are 0.90 oz/ft²; G185 has 1.85 oz/ft² and would last about two times longer than G90. G90 is the minimum protection for connectors and is standard in MiTek connectors.

Design Guidelines:

Where there are governing national or local building code requirements, they should be used in the selection of the connectors and their protection against corrosion. In the absence of such requirements, the decision rests on the experience and judgment of the building designer/engineer. Design guidelines are presented in this section to aid the building designer/engineer in this selection process, but it is the responsibility of the building designer/engineer to determine the most viable solution based on an evaluation of the connectors to the specific corrosive environment(s). The guidelines consist of best practices, recommended protection levels for the connectors, and strength modification factors for the lumber/connectors.

Where there are multiple options suggested, do not automatically default to the lowest protection level. The lower protection level is intended to address less severe conditions while the higher protection level is meant to address more severe conditions. Select the option that eliminates or adequately reduces the vulnerability of the connectors to the corrodents. When in doubt, use a higher level of protection than anticipated or seek professional consultation.

Relative Corrosion Resistance Capability:

The chart below ranks the available options in terms of their relative effectiveness against corrosion. As expected, the ability to resist corrosion increases with increasing zinc thickness, so G185 is the most durable pre-galvanized product available. Gold Coat offers enhanced protection compared to G185 while stainless steel offers the best protection for most applications.

Galvanic Corrosion:

The simplest and most practical solution to minimize galvanic corrosion is to make sure that the components that are in direct contact with each other are made of the same material or coating. Once this is achieved, there is no net galvanic potential between the components and galvanic corrosion is eliminated or significantly reduced. For example, use galvanized nails for galvanized connectors and stainless steel nails for stainless steel connectors.

Wet Service Condition:

For lumber, this refers to any service condition in which the average equilibrium moisture content is 15% or more over a year or may exceed 19% at any time. For lumber to get above 19% moisture, the relative humidity in the air needs to reach above 80%. Unfortunately, this is above the critical humidity level for the electrochemical oxidation of steel, which is around 70%. Beyond 70%, the rate of corrosion in the connectors increases rapidly due to the abundant availability of moisture.

G90 may not be suitable for use in wet service condition.

Preservative (Pressure) Treated Wood:

Although most preservatives do not reduce the strength of the lumber, some are corrosive to the metal hangers. Chromated copper arsenate (CCA), which had been the industry's standard preservative for many years, is no longer permitted for use in residential applications. It had been replaced by other preservatives such as alkaline copper quaternary (ACQ) and copper azole (CA) for exterior applications, and borates-based formulations such as disodium octaborate tetrahydrate (SBX or DOT) for interior applications.

Research conducted by USP Structural Connectors and others in the industry have concluded that ACQ and CA are more corrosive to the metal connectors than CCA, while borates-based preservatives are no more corrosive than untreated lumber. It is generally agreed and recommended that G185 should be used as the minimum protection for use with ACQ and CA treated lumber.

Fire Retardant Treated (FRT) Wood:

Although most common FRT products are not corrosive to metal connectors, not all products are non-corrosive. Additionally, they typically require proprietary strength reductions applied to the lumber in accordance with the manufacturer's specifications. Since the lumber strength is lower, the lateral and withdrawal resistance of nails must also be reduced accordingly. It is important to note that some fire retardants cause the wood to absorb more moisture from the air than untreated lumber. Consequently, the connector may be exposed to a higher level of moisture, resulting in more corrosion.

Swimming Pools:

This is one of the most hazardous environments for steel connectors due to continuous exposure to high temperature, high moisture content, and corrosive chemicals such as chlorine, bromine, and other disinfectants. The combination of all these factors can lead to accelerated corrosion and premature structural failure. This environment is so corrosive that all possible preventive measures should be employed to prevent the hanger from being exposed to the pool water. These include the use of a vapor barrier and a ventilation system that does not take the air from the pool environment.

Additionally, it has been known that certain grades of stainless steel (304, 316, and others) are susceptible to a mode of structural failure known as stress corrosion cracking (SCC) when exposed to a swimming pool environment. SCC is usually localized near areas of high residual stress and small cracks can rapidly propagate and cause catastrophic failures. See warning below.

WARNING

Stainless steel connectors and fasteners shall not be used for metal hangers over swimming pools due to stress corrosion cracking. SCC has been known to occur under the following conditions:

- Use of certain grades of stainless steel (grades 304, 316 and others).
- Structural members subjected to high tensile stress.
- Presence of certain chemicals, including chlorine and bromine.

Gold Coat may be the best choice in this environment.

The **Structural Connectors Coating Recommendations** chart below was developed by reviewing field service performance and accelerated corrosion test results. They are offered as general guidelines and are not intended to cover all possible service conditions. Additional consideration may also be needed for:

- wet service conditions
- preservation treated lumber
- fire retardant treated lumber
- strength reducing chemicals
- building near salt water coastal areas.

Additionally, the **Corrosion Protection Guidelines** to the right may also be used to assist in making the proper choice of corrosion protection.

The building designer/engineer has the ultimate responsibility of selecting the most viable protective coating based on knowledge of project specific corrosive environments and local building code requirements.

Corrosion Protection Guidelines:

- USP recommends stainless steel connectors for the highest level of corrosion protection. As an economical alternative to stainless steel our new Gold Coat connectors are specifically designed for exterior application when in contact with preservative treated wood.
- For connectors in contact with preservative treated wood, the Triple Zinc option provides the minimum G-185 coating thickness required by code and is an economical alternative for exterior applications.
- The use of correct fastener with the connector is critical. Stainless steel connectors require stainless steel fasteners. For exterior applications, hot-dip galvanized fasteners (HDG) must be used with both Triple Zinc and hot-dip galvanized finishes. Gold Coat connectors require gold coat or hot-dip galvanized fasteners.
- USP's zinc dichromate WS Wood Screws are not recommended for use with preservative or fire-retardant treated wood. Some wood screws are available in Gold Coat or hot-dip galvanized.
- USP clearly differentiates standard interior G90 connectors from the corrosion resistant connectors. Gold Coat connectors are distinguishable from other connectors due to their gold color.

Structural Connectors Coating Recommendations

AWPA ⁹ Use Category	Service Conditions	Use Environment	Example Applications	Preservatives and Retentions ^{6,7,10}	Minimum Coating Requirements ^{1,2,3,4}
UC1 Interior/Dry	Interior construction, Above ground, Dry	Continuously protected from weather or other sources of moisture	General framing, interior construction	Untreated	G90
UC2 Interior/Damp	Interior construction, Above ground, Damp	Protected from weather, but may be subject to sources of moisture	Sill plates	SBX-DOT, Organic ACQ-D (0.15), CA-B (0.10), CA-C (0.06), MCQ (0.06), μCA-C (0.05)	G90 Triple Zinc (G-185) ^{8,9}
UC3A Above Ground Protected	Exterior construction, Above ground, Rapid water runoff	Exposed to all weather cycles, not exposed to prolonged wetting	Exposed exterior beams or columns in an open, covered structure	ACQ-D (0.25), MCQ (0.15), CA-B (0.10), CA-C (0.06), μCA-C (0.05), Organic	Triple Zinc (G-185) or USP Gold Coat
UC3B Above Ground Exposed	Exterior construction, Above ground, Poor water runoff	Exposed to all weather cycles, including prolonged wetting	Deck beams and joists	ACQ-D (0.25), MCQ (0.15), CA-B (0.10), CA-C (0.06), μCA-C (0.05), Organic	Triple Zinc (G-185) or USP Gold Coat
UC4A Ground Contact General Use	Ground contact, Fresh water; includes above ground applications	Ground contact or fresh water exposed to all weather cycles, Normal exposure	Deck posts, beams and joists. Fresh water docks ¹¹	ACQ-D (0.40), MCQ (0.23), CA-B (0.21), CA-C (0.15), μCA-C (0.14)	Triple Zinc (G-185) or USP Gold Coat ⁵
UC4B Ground Contact Heavy Duty	Exterior construction, Ground contact, Critical components	Ground contact, fresh/salt water water splash exposed to all weather cycles	Permanent wood foundations, critical structural members	ACQ-D (0.60), MCQ (0.23), CA-B (0.31), CA-C (0.25), μCA-C (0.23)	Stainless Steel

- 1) G90 and G-185 refer to galvanization requirements for ASTM A653 material.
- 2) Connectors galvanized to ASTM A123 may be used in place of either G90 or G185 coatings.
- 3) Other coating may be suitable for a given environment if the conditions are known and predictable.
- 4) For G185 connectors use fasteners galvanized per ASTM A153. For Gold Coat connectors, use Gold Coat fasteners and for stainless steel connectors, use stainless steel fasteners.
- 5) If the environment has the potential to contain elements which may make it more corrosive, the use of stainless steel is recommended.
- 6) MCQ is a micronized copper treatment such as *Micro Pro* by Koppers. μCA-C is a dispersed copper treatment manufactured by Arch Treatment Technologies. Organic preservatives include L³ from Arch Treatment Technologies and EcoLife II from Viance, LLC.
- 7) For wood treatments not shown, contact USP or the wood preservative manufacturer for recommended coatings.
- 8) Testing by USP has found that in interior applications where the treated wood will remain relatively dry during its service life the use of G90 connectors with MCQ or μCA-C treated wood is appropriate.
- 9) American Wood Protection Association Standard U1-16.
- 10) SBX/DOT= Sodium Borate; ACQ-D = Alkaline Copper Quat Type D; CA-B = Copper Azole Type B; CA-C = Copper Azole Type C; MCQ = Micronized Copper Quat; μCA-C = Dispersed Copper Azole Type C. The number listed in the parenthesis is the required retention level in pounds per cubic foot, or PCF.
- 11) Deck joists and beams must be treated to Use Category UCA4 when they are difficult to maintain, repair or replace and are critical to the performance and safety of the deck.

Corrosion Information

USP offers several corrosion resistant finishes to cover a range of corrosion performance. For products available in corrosion resistant finishes, reference the "Corrosion Finish" column in the charts and Corrosion Key located by the chart footnotes or our Corrosion Protection Advisory Technical Bulletin www.USPconnectors.com/pdf/resources/technical-bulletins.

Corrosion Protection Level	Finish	Description	Required Fastener	Ordering
	G90 Galvanizing	Galvanizing provides a prefabrication coating of 0.90 ounces of zinc per square foot of surface area measured in accordance with ASTM A 653.	Bright fasteners	Stock number as listed in the chart
	Triple Zinc (TZ) (G-185 Galvanizing)	TZ galvanizing provides a prefabrication coating of 1.85 (G-185) ounces of zinc per square foot of surface area (both sides) measured in accordance with ASTM A 653.	Hot-dip galvanized fasteners	To order, add TZ to stock number, as in C44-TZ
	Hot-Dip Galvanized (HDG)	HDG coating provides an after-fabrication hot-dipped zinc coating. The coating thickness is dependent on the connector material, but generally ranges from 1.2 to 2.3 ounces of zinc per square foot of surface area (both sides). Hot-dip products meet requirements set forth in ASTM A 123.	Hot-dip galvanized fasteners	To order, add HDG to stock number, as in KCC44-HDG
	Gold Coat (GC)	Gold Coat is a proprietary multi-layer protection system. It is comprised of an organic top coat barrier layer and a zinc layer placed over a steel substrate.	Gold Coat or Hot-dip galvanized fasteners	To order, add GC to stock number, as in AC7-GC
	Stainless Steel (SS)	Best option for corrosion protection. Quality stainless steel (316SS grade steel) is used to fabricate connectors. Although costs are higher, some applications may need the virtual corrosion proof quality of stainless steel.	Stainless Steel fasteners	To order, add SS to stock number, as in PBES44-SS

DISCLAIMER

The general information and guidelines provided in this USP Product Catalog shall not be used as a substitute for competent professional examination and verification. It is the responsibility of the building designer/engineer to determine the applicability and suitability of the information provided. Anyone making use of this information assumes all responsibility and liability arising from such use.

U.S. Standard Steel Gauge Equivalents in Nominal Dimensions

Gauge	Approximate Dimensions		Decimals (inches)		
	Inches	Millimeters	Uncoated Steel	Galvanized Steel (G90)	Triple Zinc (G-185)
3	1/4	6.0	0.238	---	---
7	3/16	4.5	0.171	0.186	---
10	9/64	3.4	0.129	0.138	0.140
11	1/8	3.0	0.114	0.123	0.125
12	7/64	2.7	0.099	0.108	0.110
14	5/64	2.0	0.070	0.078	0.080
16	1/16	1.5	0.055	0.063	0.065
18	3/64	1.2	0.044	0.052	0.054
20	1/32	1.0	0.033	0.040	0.042
22	1/32	0.8	0.029	0.033	0.036

*Actual steel dimensions will vary from nominal dimensions according to industry tolerances.

Maximum Shear Capacity of Joist or Rafter

The table below indicates the calculated shear capacity of different dimensional lumber sizes for various wood species.

Nom Dim	DF Factored Shear Resistance ^{1,2,4}				S-P-F Factored Shear Resistance ^{1,2,4}			
	Lbs		kN		Lbs		kN	
	100%	115% ³	100%	115% ³	100%	115% ³	100%	115% ³
2 x 4	1476	1697	6.57	7.55	1165	1340	5.18	5.96
2 x 6	1910	2197	8.50	9.77	1508	1734	6.71	7.71
2 x 8	2158	2482	9.60	11.04	1703	1958	7.58	8.71
2 x 10	2524	2903	11.23	12.91	1992	2291	8.86	10.19

- 1) Applies to nominally dimensioned joist as listed in dry service conditions and temperatures less than 38° C.
- 2) Loads apply to: DF: Douglas Fir-Larch (G=0.49), $f_v=1.9$ Mpa; S-P-F: Spruce-Pine-Fir (G=0.42), $f_v=1.5$ Mpa
- 3) 115% loads are increased for short term loading in accordance with the code. $K_D = 1.15$.
- 4) Assumes system factor $K_H = 1.00$.

Roof Pitch

If common Rafter Roof Pitch is ...

Rise / Run (inches)	Slope (degrees)
1/12	5
2/12	10
3/12	14
4/12	18
5/12	23
6/12	27
7/12	30
8/12	34
9/12	37
10/12	40
11/12	42
12/12	45

Then Hip/Valley Rafter Roof Pitch becomes ...

Rise / Run (inches)	Slope (degrees)
1/17	3
2/17	7
3/17	10
4/17	13
5/17	16
6/17	19
7/17	22
8/17	25
9/17	28
10/17	30
11/17	33
12/17	35

Slope Conversion Table

Rise / Run (inches)	Slope (degrees)
0/12	Flat
1/12	5
2/12	10
3/12	14
4/12	18
5/12	23
6/12	27
7/12	30
8/12	34
9/12	37
10/12	40
11/12	42
12/12	45

- 1) Use this conversion table only for hip/valley rafters that are skewed 45° right or left. All other skews or dual pitch roofs will cause the slope to change from that listed above.

Special & Custom Connectors

USP is committed to meeting every need you have and we understand that stock connectors will not meet all application or design requirements. Our Technical Assistance Representatives will work with you to develop and fabricate the Special or Custom connector you need.

What is the difference between a "Special" and a "Custom" connector?

A "Special" is a stock USP connector that is modified within the limits listed in the Specialty Options chart for that connector. A summary of Specialty Options can be found on page 220 of this catalog.

A "Custom" is a connector that does not closely resemble a stock or special part offered in our catalog. Also, a "Custom" connector may be a stock connector that is modified outside of the limits listed in the Specialty Options charts or is not listed in the catalog as having a specialty option available. Product drawings must be provided by the customer and will be manufactured by USP in accordance to customer specifications.

See pages 220-224 for additional information.

Special Order EXAMPLE: Skewed HD < 45°

Custom Order EXAMPLE: 4-Pocket Girder Truss Hanger

- 1) This catalog reflects the most current information available at the time of printing. However, we are continually improving our products through better engineering design and development and recommend visiting our website for the latest on-line version of the catalog. USP Structural Connectors reserves the right to change specifications, designs, and models at any time without notice and liability for such changes. This catalog may not be reproduced in whole or in part without the prior written approval of USP Structural Connectors.
- 2) This catalog reflects changes to product design and factored resistance to some USP Structural Connectors products. The information presented in this publication supersedes all previously published Product Catalogs and is valid until December 31, 2016.
- 3) This Product Catalog was designed as a general reference for the USP Structural Connectors Product Line. Various specialized publications have also been developed for design professionals, truss manufacturers, contractors, and building material distributors. Consequently, product information may vary from one publication to another due to product development testing and revisions to code evaluation report upgrades. We recommend visiting our website for the latest on-line version of these specialized publications.
- 4) The type and quantity of fasteners used to install USP Structural Connectors products is critical to connector performance. To achieve the factored resistance presented in this catalog, all specified fasteners must be used and proper installation procedures observed. Verify that the dimensions of the supporting members are sufficient to receive the specified fasteners. All product modifications will void the warranty unless prior written consent from USP Structural Connectors has been obtained.
- 5) Some connector models are listed more than once to indicate installation and/or fastener options.
- 6) New products or updated product information are designated in **blue**.
- 7) Throughout this catalog, dimensions are expressed in inches and loads in pounds unless specifically noted otherwise.
- 8) Some USP Structural Connectors products show both nail fastening and bolt schedules. In those cases, specific loads for each has been identified. Nail and bolt values cannot be combined unless noted otherwise.
- 9) Load values for 8d, 10d, 16d, and 20d designations in the fastener schedules throughout this catalog refer to common wire nails unless noted otherwise. Nails shall conform to a recognized national standard, such as ASTM F1667, as prescribed by the model building codes.
- 10) Diamond holes are for optional nailing.
- 11) Fastener installation may cause wood to split and reduce a fastener's ability to transfer loads into the supporting member. If wood splitting occurs, consider pre-drilling holes not exceeding 75% of the nail diameter (per the National Design Specification for Wood Construction (NDS) Section 11.1.6.3).
- 12) Bolts specified in this catalog are through-bolts and must conform to requirements for ASTM A 307 Grade A, or ASME SAE Grade 2, or better unless noted otherwise.
- 13) Anchor Bolts must conform to ASTM F 1554.
- 14) USP connectors listed in this catalog are manufactured for specific sizes of standard dimensional lumber, plated trusses, or structural composite lumber. For applications involving unusual supporting conditions environments, contact USP. Wood shrinkage or expansion, caused by lack of moisture or excessive moisture, may adversely affect connector installation. Evaluate potential shrinkage or expansion to ensure proper connector installation and performance.
- 15) The load values listed in this catalog are based on installation to wood with a moisture content of less than 19%, and used in dry service conditions. Load reductions, in accordance with the applicable local Building Code, shall be taken where wood moisture content is greater than 19% at the time of installation or where used in wet service conditions.
- 16) Unless otherwise noted, USP products may not be bent or cut for any reason unless prior written consent from USP Structural Connectors has been obtained. Field alterations may significantly reduce the published factored resistances values in this catalog.

- 1) Factored resistances for more than one direction for a single connection cannot be added together. A design load which can be divided into components in the directions given must be evaluated as follows:

Factored uplift / Factored uplift resistance + Factored parallel to plate / Factored parallel to plate resistance + Factored perpendicular to plate / Factored perpendicular to plate ≤ 1.0

- 2) Connector ratings may exceed the tensile strength or other aspects of the wood members involved in the connection. A qualified designer should verify wood member capacities when specifying connectors.
- 3) Verify that the size of the supporting member can accommodate the connector's specified fasteners.
- 4) Some illustrations in this catalogue may not reflect additional mechanical reinforcements which may be required to reduce cross grain tension or wood member bending under loading. The design professional is responsible for determining if additional mechanical reinforcement is required.
- 5) USP recommends the hanger height be a minimum of 60% of the joist height for stability.

Limit States Design

The factored resistance values presented in this catalogue are for Limit States Design (LSD) in accordance with the 2010 National Building Code of Canada (NBCC). The values have been developed by either testing to CSA 086, or soft converted from working stress design. These procedures are summarized as follows:

(a) Testing to CSA 086

Products that have been evaluated to the CSA Standard are listed under the Codes heading in each product series section if applicable. Visit USP's Web Site, <<http://www.USPconnectors.com/>>, or specific code agencies web site for current listing. Code evaluation numbers listed in this catalogue may not apply to all stock numbers or product series listed.

Standard term resistance values have been established by testing to ASTM and the CSA-086 using the following criteria:

- Lowest corrected ultimate load multiplied by 0.91 and a resistance factor of 0.6.
- The average load at 1/8" deflection multiplied by 2.42 and a resistance factor of 0.6.

(b) Soft Conversion from Working Stress Design

The soft converted values use the allowable working loads developed in the United States using the 2005 National Design Specification and the ICC-ES AC13 "Acceptance criteria for Joist Hangers and Similar Devices." These allowable working loads are based on testing to ASTM D7147, D1761 and calculations on the fasteners and wood bearing using the NDS. They were soft converted by multiplying the floor load case ($(K_D)=1.0$) by 1.44 to obtain standard term load resistance in Limit States Design.

The soft converted value of each bolted connector has been also compared to the calculated resistance of the bolts as given in CSA 086. The lower of the two values is given in the tables.

Material

USP selects steel for its various products in accordance with application needs and steel properties, including tensile strength, ductility, corrosion resistance, gauge, and weldability. See specific code evaluations or consult USP for steel information on specific products. USP Structural Connectors® are manufactured from steel which meets ASTM A 653, ASTM A 1011, or ASTM A 36.

Product Design Loads

Factored resistance values in this catalogue are given for standard term loading and/or short term loading as described below:

(a) Standard term loading

This includes the effects of dead loads plus loads due to snow or use and occupancy in which the duration of load factor (K_D) in CSA 086 is equal to 1.0. Therefore, connectors carrying roof or floor members should be selected using the standard term load resistance. In many tables this is designated as "vertical (100%)" or "bearing (100%)". The 100% indicates that no duration of load increase is included.

(b) Short term loading

This case refers to loading that will not exceed 7 days throughout the life of the structure and includes wind and earthquake loads. Short term loading has a duration of load factor (K_D) of 1.15 included. In the tables short term loading resistance is also designated as "uplift (115%)".

In some cases the strength of the steel governs the resistance values and therefore no increase for short term loading is included.

Installation Notes

- 1) Use proper safety equipment during connector installations. Always wear gloves when handling connectors.
- 2) All field welding should be done in accordance with CSA W59 Codes. Caution: Welding galvanized steel may produce harmful fumes and should only be performed in well-ventilated environments.
- 3) The type and quantity of fasteners used to install USP products is critical to connector performance. To achieve the factored resistance shown in this catalogue, install with the fasteners specified for that particular product. Some products allow for alternate nail installations. Refer to the "Optional Nails for Face Mount Hangers" chart on page 19 of this catalogue for load adjustments when using alternate nailing. All specified fasteners must be properly installed prior to applying load of any kind to the connection.
- 4) Drill bolt holes a minimum of 1/32" and a maximum of 1/16" larger than the diameter of the bolt to be installed. Per CSA 086-14 Clause 12.4.1.2.
- 5) Washers should always be used under the head or nut of a bolt when not in contact with the connector unless noted otherwise.
- 6) It is permissible to use nail guns to install connectors as long as the specified nails are installed through pre-punched nail holes and all specified nail holes are filled. USP recommends the use of nail guns featuring hole-locating mechanisms. Please note that many nail guns use fasteners smaller than the common nail size and load reductions will result. Contact USP or visit our Web Site for additional information. Caution: Always follow nail gun manufacturer's safety guidelines.
- 7) Joists installed in hangers should bear fully on the connector seat and shall be cut to fit against the header with a gap no greater than 1/8" between the joist end and header face.
- 8) Multiple-ply members must be fastened securely together to act as one member.
- 9) Top mount hangers shall be installed with the face of the hanger tight to the face of the header
- 10) Top mount hangers installed in floor systems may produce unevenness. This may vary by the thickness of the hanger top flange steel and the nail heads. If a problem is anticipated, the effects can be mitigated by dapping the beam or cutting the subfloor at hanger locations. The use of face mount hangers will eliminate this problem.

Proper fasteners are a critical component in a sound wood frame structure. To ensure successful installations of its connectors, USP offers a full range of structurally-rated nails. All galvanized nails supplied by USP are Hot-dipped for greater corrosion resistance. Any USP connector requiring a NA16D-RS or NA20D nail is shipped with the nails attached to the connector in convenient poly bags.

Fasteners

Nail Specification Table

1) Factored shear resistance values determined in accordance with **CSA 086-14 Section 12.9**.

2) Factored shear resistance values apply to DF: Douglas Fir (SG=0.49, fv=1.9 MPa) and S-P-F: Spruce-Pine-Fir (SG=0.42, fv=1.5 MPa).

3) Fastener values shown in this table are for 16Ga steel side member with Fu=45,000 psi and design metal thickness of 0.058 inch (1.47mm).

Approximate fastener values for other steel thicknesses can be determined as follows:

For 18Ga steel (0.046 inch, 1.17mm), multiply table values by 0.91

For 14Ga steel (0.074 inch, 1.88mm), multiply table values by 1.05

For 12Ga steel (0.104 inch, 2.64mm), multiply table values by 1.05

4) Fastener values shown are based on standard-term load duration of K_D = 1.00. Values may be adjusted for other load durations.

5) HDG = Hot-Dip Galvanized; SS = Stainless Steel; GC = Gold Coat; Bright = No Finish.

6) Bright finish common, sinker, and spiral nails are listed for reference only. USP does not stock these type nails.

New products or updated product information are designated in **blue font**.

Gun-Nails:

It is permissible to use nail guns to install connectors.

Note:

- Many nail guns use fasteners smaller than the common nail size specified with USP product, factored resistance must be reduced accordingly.
- Drive through pre-punched nail holes only.
- Do not over drive.
- Recommend the use of guns featuring hole-locating mechanisms.

 Round Holes: Always fill all (normal-size) round nail holes, unless otherwise noted.	 Diamond Holes: For maximum listed capacity.	When there are MIN and MAX values: MIN: fill all round nail holes MAX: fill all round and diamond holes
 Large Round Holes: For concrete/masonry installation; no need to be filled when connected to wood.	 Obround Holes: For ease of nailing at a tight location; always fill.  Right skew Drive nails at angle Left skew	
 Dimple Holes: Guide double shear nails into the joist and header at a 30° to 45° angle  Use specified standard length common nails. 16d common and 10d common nails are 3-1/2" and 3" long respectively.	 Bend-line Holes  Drive bend line nails into header at 45° to achieve published strength	
Typical I-Joist Nailing  Slant Nailing via dimple nail holes Seat Cleat® helps lock I-Joist into place for positive seating and nailing ease Do not nail through the Seat Cleat® Diamond holes (no need to fill unless otherwise noted)		
Common Nailing Errors Wrong Angle When a nail is driven into the bottom flange of the wood I-Joist parallel to the glue lines, separation of veneers can occur which substantially reduces the design loads of the connection. Nail Too Long When using nails longer than USP's recommended nails, bottom flange splitting may occur. Also, this can raise the wood I-Joist off the seat, resulting in uneven surfaces and squeaky floors along with reduced factored resistance. 		

Optional Nails for Face Mount Hangers
(Does not apply to slant nail hangers: HUS, JUS, MSH, MUS, THDH)

Specified Nail	Replacement Nail	Strength Adjustment Factor
10d x 1-1/2 (0.148" x 1-1/2")	8d x 1-1/2 (0.131" x 1-1/2")	0.88
10d common (0.148" x 3") 12d common (0.148" x 3-1/4")	8d common (0.131" x 2-1/2")	0.82
	10d spiral (0.122" x 3")	0.73
	10d x 1-1/2 (0.148" x 1-1/2")	0.90
	8d common (0.131" x 2-1/2")	0.71

	12d common (0.148" x 3-1/4")	0.86
	10d spiral (0.122" x 3")	0.61
	12d spiral (0.122" x 3-1/4")	0.61
	16d spiral (0.152" x 3-1/2")	0.90
	10d x 1-1/2 (0.148" x 1-1/2")	0.78
	16d x 2-1/2 (0.162" x 2-1/2")	1.00

1. This chart does not apply to custom hangers or hangers modified to skew and/or slope.
2. This chart applies to metal side member of 14Ga or thinner. For steel thicker than 14Ga, contact USP for exceptions.
3. Strength adjustment factor is the multiplier to the published factored resistance when a nail of different size and/or type is used in lieu of a Specified Nail.
4. Roofing nails shall not be substituted for any nail size or type.
5. Decking nails are not to be used as a substitution for any load carrying nails.

The WS Wood Screw is a self-drilling screw used for numerous framing applications. This screw features a reverse locking serration on the bottom of the screw head to help prevent over tightening against a steel plate. The USP head stamp identifies screws for easy inspection.

Screw shear capacities are based on a diameter of 0.242" when the shear plane is on the screw shank (SH) and 0.185" when the shear plane is on the knurl or threads (T). USP WS Wood Screws have a bending yield strength of 180,000 psi. For conditions not charted here, screw loads may be calculated in accordance with CSA 086-14 Clause 12.11.

Materials: 1/4" diameter Grade 5 steel

Finish: See chart

Options: See chart for Corrosion Finish Options.

Installation:

- Screws are self-drilling.
- Install using a low speed clutch drill with 3/8" hex head driver. The washer head should be flat to the surface and the serrations will oppose turning and release the clutch. Do not over-tighten the screws.
- Installing the screw at an angle may introduce additional bending and tension forces into the fastener if the screw head is not flat on the bearing surface. Care should be given to ensure the fastener is installed perpendicular to the plane of the side plate.
- For attaching multi-ply wood trusses or LVL or PSL members, or floor trusses, see pages 21-23.

1) Zinc = Yellow zinc dichromate.

2) Factored Resistance values determined in accordance with **CSA 086-14 Clause 12.11**.

3) Steel side plate factored resistance based on a minimum $F_u = 45,000$ psi.

4) Wood-to-wood loads are based on 1-1/2" thick wood side members.

5) Loads are for 100% duration of load factors, and may be increased for other duration factors allowed per governing building code.

6) Loads are for shear applications when used as described in this catalog. Please contact USP for applications and installations involving tension forces.

New products or updated product information are designated in **blue font**.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

Joining 2, 3, or 4 Ply Wood Trusses

The installation instructions and design example shown below are intended for a design professional who will be responsible for determining the location and number of wood screws to adequately transfer all loads on the truss.

Installation:

- Screw spacing shall not be greater than 24" on center and less than 4" on center. However, the location of any individual screw may be adjusted up to one-half the required screw spacing to avoid lumber defects or interference with other hardware.
- Load or hanger spacing shall not be greater than 24" center-to-center.
- The last truss ply must have a minimum of 1-1/4" of screw penetration and no more than 1/8" gap between each ply.
- Screws cannot be installed through metal truss plates unless the Truss Engineer approves pre-drilling.
- On 2x4 members, use one row of wood screws. On 2x6 and 2x8 use two rows, and on 2x10 use three rows. Stagger all rows.
- The truss bottom chord shall have lateral bracing installed as called out by the Truss Engineer to prevent any displacement from torsional forces.
- Install screws from one side without flipping the truss.
- Top and bottom chords require screws and in some cases the webs may require screws.
- All lateral bracing should be attached to each truss ply.
- Increase edge and end distance if wood splitting occurs.

Size		USP Stock No.	Dimensions (in)			Finish	Shear Plane Location	DF		S-P-F	
in	mm		L	SH	T			Factored Resistance		Factored Resistance	
								Shear 100% ^{1,2,3,4}		Shear 100% ^{1,2,3,4}	
								Lbs	kN	Lbs	kN
1/4 x 3	6.1 x 76.2	WS3	3	3/4	2	Zinc	SH, T	387	1.72	332	1.48
1/4 x 4-1/2	6.1 x 114.3	WS45	4-1/2	1-1/4	3	Zinc	SH, T	543	2.42	480	2.14
1/4 x 6	6.1 x 152.4	WS6	6	1-3/4	4	Zinc	SH, T	543	2.42	480	2.14

1) Factored Resistance values determined in accordance with **CSA 086-14 Clause 12.11**.

2) The Truss Engineer shall apply all applicable adjustment factors.

3) Table values are based on 1-1/2" thick wood side members. **Where the side and main members are of different specific gravities, use the lower of the two.**

4) Table values depicted assume the wood screws installed with the screw heads in the loaded ply.

Design Example

3 Ply with Mixed Wood Species:

Bottom Chord: 2x6 Douglas Fir-Larch

Top Chord: 2x4 Spruce-Pine-Fir

WS45 Wood Screw Factored Resistance:

Douglas Fir-Larch: 543 lbs. each at 100%

Spruce-Pine-Fir: 480 lbs. each at 100%

Bottom Chord Wood Screw Spacing:

Using 2 rows of WS45 Wood Screws in 2x6

$$2 \times 543/1000 \times \frac{\# \text{ Plies}}{\# \text{ Plies} - 1} = 1.63 \text{ ft.}$$

Use maximum spacing of 19".

Top Chord Wood Screw Spacing:

Only 1 row of WS45 Wood Screws in 2x4 member

$$1 \times 480/120 \times \frac{\# \text{ Plies}}{\# \text{ Plies} - 1} = 6 \text{ ft.}$$

Use maximum spacing of 24".

Required Loads:

Bottom Chord Factored Load: 1000 plf

Top Chord Factored Load: 120 plf

Typical Truss Profile (profile may vary)

Joining 2, 3, or 4 Ply LVL, LSL or PSL Members

Installation Notes:

- For 2 ply members, wood screws shall be installed with the screw heads in the loaded ply.
- For 3 or 4 ply members, wood screws shall be installed in both outer plies.
- Designer shall specify all wood screws locations.
- Increase edge and end distances if wood splitting occurs.
- Stagger all screws installed into the opposite face.
- A minimum of 2 rows of screws shall be used for all members with $H = 5\text{-}1/2"$ and larger.

Size (in)	USP Stock No.	Dimensions (in)			Multiple Members Installation Figure ^{3,7,9,10}	Maximum Factored Uniform Loads that can be applied to either outside member ^{1,2,3,4,5,6}

1) Factored Resistance values determined in accordance with CSA 086-14 [Clause 12.11](#).

2) Loads are based on SCL with an equivalent S.G. = 0.50 and a side member thickness of 1-3/4", except for Figure 6 installation with a side member thickness of 3-1/2".

3) Load values depicted assume that the uniform load is applied to the most narrow outside ply only.

4) Except for Figure 6 installation, load values neglect any contribution of screws installed to opposite side, even if they extend significantly into the loaded ply.

5) Loads are for normal (100%) duration of load, and may be increased in accordance with the code.

6) Uniform loads in table represent the capacity of the fasteners. The capacity of the LVL or PSL beam may be less and should be checked by a qualified designer or with the manufacturer's literature.

7) A qualified designer shall ensure the adequacy of a 7" wide beam to resist the applied load on one edge; otherwise, the loads shall be uniformly distributed across the width or applied equally on both sides.

8) Wood screws longer than 3-1/2" are not recommended for use with Parallam® PSL or TimberStrand® LSL.

9) For Figure 1: The head of the wood screw is on the same side as the loaded ply.

10) For Figures 2, 3, 5, and 6: Stagger the screws on opposite face by half minimum spacing requirements.

Recommended Row Guidelines

Joining 2 Ply 4x2 Floor Trusses

The following information pertains to the use of the USP's WS6 Wood Screws to fasten together a two-ply 4x2 floor truss girder, such that the induced loads are supported by both truss plies. Screw spacing and the location of each specific screw may vary depending on the design criteria for each application, and therefore must be determined by the truss or building designer. However, in the determination of screw locations, the following criterion shall also be considered. These criterion are varying dependent upon how trusses are loaded as follows:

Uniform/Distributed Load

- Screws shall be installed into the top chord with a horizontal spacing between screws of not less than 4-inches on center and not more than 24-inches on center.
- A minimum end distance of 4-inches must be maintained. If necessary, additional screws may be installed in the bottom chord.
- Center screw vertically on 1-1/2" dimension of top chord. If splitting occurs, it may be necessary to predrill the holes in accordance with the code.
- The screws shall be installed with the headed end of the screw on the loaded truss. If either ply is "the loaded truss", the screws shall be divided between the two plies, with the spacing on each side twice the minimum indicated above.
- The screws shall not be installed through the metal truss plates, unless approved by the truss designer and the plates are predrilled, on each side to a 1/4-inch diameter. Do not drill through the wood.
- The maximum gap between the wood members of the two trusses shall be 1/8-inch.
- Individual screw locations may need to be adjusted to avoid conflicts with connectors, problematic wood or other framing members. Adjustments should follow the criteria described in this section.

Concentrated/Point Load

The placement of fasteners for concentrated loading includes all requirements of uniform loading with the following additional criteria:

- Loads must occur over a vertical member, and the necessary concentration of screws shall be installed in the vertical member.
- Additional screws may be installed on the top chord and adjacent web members if necessary.
- The fasteners should be grouped as close to the concentrated load as possible, but satisfy the same minimum spacing indicated for uniform loading.
- In no case shall the required group of fasteners extend beyond 12-inches from the location of the concentrated load.

LL Lumberlok Structural Connector Screws

The LumberLok Structural Connector Screw is a self-drilling screw that can be used with a number of USP Structural Connectors and also for wood-to-wood applications. The screws feature a T20 Torx® head with integral washer and gimlet point for ease of installation. The twin-lead threads drive in twice as fast as the single lead threads significantly reducing installation time. The USP head stamp identifies the screw length for easy inspection.

Screw shear capacities are based on a diameter of 0.162" when the shear plane is on the screw shank (SH) and 0.109" when the shear plane is on the threads (T). USP LumberLok Structural Connector Screws have a bending yield strength of 180,000 psi.

Materials: Low carbon hardened steel

Finish: Gold Coat

Installation:

- Screws are self-drilling.
- Install using a low speed clutch drill with T20 Torx® bit (not included). The washer head should be flat to the surface. Do not over-tighten the screws.
- Installing the screw at an angle may introduce additional bending and tension forces into the fastener if the screw head is not flat to the bearing surface. Care should be given to ensure the fastener is installed perpendicular to the plane of the fastener hole.
- **Impact drills are not recommended for use with LumberLok Screws**

Size	USP Stock No.	Ref. No.	Dimensions (in.)			Finish ²	Unit	DF				S-P-F

							kN	1.01	1.28	1.11	1.18	0.87	0.97	1.01	1.08

1) Factored Resistance values determined in accordance with **CSA 086-14 Section 12.9**.

2) GC = Gold Coat over Clear Zinc Trivalent.

3) Factored shear resistance for steel-to-wood assumes a side plate tensile strength of 45 ksi.

4) Withdrawal loads for steel-to-wood connections assume a side plate thickness of 1/4" or less.

5) Shear loads for wood-to-wood connections assume a side member thickness of 1-1/2".

6) Loads are for 100% duration of load factors, and may be increased for other duration factors allowed per governing building code.

New products or updated product information are designated in **blue font**.

CIA-GEL 7000-C Epoxy

CIA-GEL 7000-C Epoxy is an adhesive designed to attach anchor bolts into concrete that is, or may become, cracked due to cyclic loading from wind or earthquakes. It may also be used with fully grouted CMU construction. It is a low odor, solvent free, non-shrink, non-sag adhesive. The two-component (resin and hardener) epoxy is supplied in equal volume cartridges, which are combined in a 1:1 ratio when dispensed through the attached mixing nozzle. Either a hand powered or air-powered dispenser may be used. The cartridges are sealed with a D-plug which opens easily on the job-site and allows partially used cartridges to be saved for later use. The epoxy has a two year shelf life when stored in unopened containers at temperatures between 10°C / 50°F and 25°C / 77°F.

Applications:

- Anchors continuously threaded steel rod and deformed rebar into concrete.
- Holdowns into concrete for high seismic zones ($I_E F_a S_a (0.2) \geq 0.35$).
- Horizontal and overhead anchoring applications (requires special inspection).

Available in:
 8.5 oz. – GEL7C-10
 20.3 oz. – GEL7C-22

CIA-GEL 7000 Epoxy

CIA-GEL 7000 Epoxy is a structural adhesive specifically designed to attach anchor bolts into fully grouted concrete masonry units (CMU) and has recently been evaluated for seismic, sustained load, elevated temperature and freeze-thaw suitability conditions. It can also be used to install anchor bolts into uncracked concrete and reinforced brick. It is a low odor, solvent free, non-shrink adhesive. The two-component (resin and hardener) epoxy is supplied in equal volume cartridges, which are combined in a 1:1 ratio when dispensed through the attached mixing nozzle. Either a hand powered or air-powered dispenser may be used. The cartridges are sealed with a D-plug which opens easily on the job-site and allows partially used cartridges to be saved for later use. The epoxy has a one year shelf life when stored in unopened containers at a temperature of 21°C / 70°F.

Applications:

- Anchors All-Thread rod and deformed rebar into fully grouted CMU.
- Brick veneer anchoring.
- Crack injection of medium to wide cracks.
- Anchors rebar and threaded steel rod into uncracked concrete.

Available in:
 8.6 oz. – GEL7-10
 21.2 oz. – GEL7-22

CIA-GEL 6000-GP Epoxy

CIA-GEL 6000-GP is a superior epoxy specifically designed for general purpose structural applications that require quick load times and for doweling applications. It is a two-component (1:1 ratio) adhesive epoxy with 100% solids and is solvent free, moisture insensitive, non-sag and has no odor. It provides exceptional strength in anchoring and doweling applications and can be used in temperatures between 1°C / 35°F and 45°C / 110°F. The epoxy has a two year shelf life when stored in unopened containers at temperatures between 4°C / 40°F and 35°C / 95°F.

Applications:

- Doweling applications for rebar and tie bars for full depth concrete pavement repairs.
- Anchoring and bracing for short term tensile load where dynamic, vibratory, wind or intermittent loads exist.
- Use in concrete, grout filled block and unreinforced masonry for general purpose anchoring and doweling applications.
- Concrete doweling road repairs where DOT approval is required.

Available in:
 21.2 oz. – GEL6GP-22

CIA-EA Epoxy Acrylate

CIA-EA Adhesive Anchoring System is an epoxy acrylate specifically designed to be a high strength, fast cure structural adhesive for anchoring threaded rod and deformed rebar into uncracked concrete. It has the added advantage of being formulated to be used in colder temperatures 0°C / 32°F while maintaining excellent flowability. CIA-EA may also be used with fully grouted CMU and reinforced brick construction. It is a 2-component, 100% solids, moisture insensitive adhesive that is ideally suited for a wide range of applications. It is composed of a proprietary blend of solvent free epoxy acrylate resin and is backed by independent research and testing. The epoxy has a 15 month shelf life when stored in unopened containers at temperatures between 5°C / 41°F to 25°C / 77°F.

Applications:

- Anchors All-Thread rod into concrete
- May also be used to anchor rebar, starter bars and dowels
- Applications requiring fast cure times
- Cold weather applications
- Can be used in horizontal anchoring applications
- Can be used in overhead anchoring applications (requires special inspection)

Available in:
9.4 oz. – EA-10
27.9 oz. – EA-28

IB-9 Incredi-Bond® Epoxy

Incredi-Bond® is a high strength two-component epoxy specifically designed to be a bonding agent for almost all household materials including wood, steel, concrete, brick, stone and CMU block. It is moisture insensitive and can also be used to fill cracks in concrete, block and stone. The epoxy has a 2 year shelf life when stored in unopened containers in dry conditions between 4°C / 40°F to 35°C / 95°F.

Applications:

- Bonding applications for:
 - Concrete
 - Brick
 - CMU block
 - Stone
 - Metal
 - Wood
- Repair vertical and overhead cracks in concrete (non-structural)
- Repair vertical and overhead spalls in concrete (5/8" deep & 3" diameter max)
- Non-sag consistency makes this ideal for corner repairs to concrete and block walls
- Repair and replace brick
- Replace pool tile (no need to empty pool)
- Fill holes and cracks

Available in:
8.6 oz. – IB-9

Mechanical anchor expanded into a hole that has been undercut at the bottom using an undercutting drill bit creating a true bearing type anchor that performs like a cast-in-place headed anchor. Load is transferred into the concrete through bearing, not friction like traditional expansion anchors. Excellent performance in seismic and dynamic loading conditions.

Rod Materials: ASTM A36 (L Series), A193 Grade B7 (H Series), or AISI 316 Stainless Studs

Anchor Body Materials: ASTM A 513 Type 5, or AISI 316 Stainless

Installation:

1
Drill the hole to proper depth and diameter per specifications using rorohammer and stop drill.

2
Clean the hole using a blow-out bulb or compressed air.

3
Insert the undercut bit and start rorohammer. Undercutting is complete when the stopper sleeve is fully compressed (gap closed).

4
Clean the hole again using a blow-out bulb or compressed air.

5
Insert anchor into hole. Place setting sleeve over anchor and drive the expansion sleeve over the expansion coupling.

6
Verify that the setting mark is visible on the threaded rod above the sleeve.

7
Apply proper torque.

1) Factored resistance and shear capacities are for anchors installed at standard edge distance and spacing in uncracked concrete.

The Wedge-Bolt®+ anchor is a one piece, heavy duty screw anchor with a finished hex head. It is simple to install, easy to identify and fully removable. The Wedge-Bolt®+ has features and benefits that make it well suited for many applications. The steel threads along the anchor body tap into the hole during installation to provide key engagement. Suitable base materials include normal-weight concrete, structural sand-lightweight concrete, concrete over steel deck, concrete masonry and solid clay brick. The anchor is designed for structural loading in cracked and uncracked concrete.

SCV / SCH Safety Caps

Brightly colored safety caps protect against injuries from vertical rebar.

Materials: Composite Plastic

Finish: None

USP Stock No.	Ref. No.	Description	Dimensions (in)
SCH	-- --	Horizontal Safety Cap	2-3/8 x 2-1/2 x 2-1/2
SCV	-- --	Vertical Safety Cap	3-1/4 x 3-3/4 x 3-3/4

SCH

SCV

Typical SCH installation

Typical SCV installation

USP has added longer length THR's to support the new deck oriented code requirements for mechanically reinforced railing post and deck to house ledger board attachments.

Materials: ASTM A 36 Steel, also conforms to ASTM F 1554 Grade 36

Finish: Hot-dip galvanized

Installation:

- Install into wet concrete or drill minimum 1/16" oversized hole and secure with anchor epoxy

Typical THR installation

THR

USP Stock No.	Ref. No.	Bolt Dia.	L (in)	Corrosion Finish
THR125-HDG	RFB#4X5HDG	1/2	5

CRE48	-- --	10 mm	48

New products or updated product information are designated in **blue font**.

CRE

Typical CRE installation

NSR Round Nail Stake

Nail stakes are used to secure form boards to prevent movement and bowing.

Materials: Steel

Finish: Black Primer

Installation:

- Fastener holes will accommodate up to a 16d duplex nail.

USP Stock No.	Ref. No.	Dimensions (in)	
		Dia	L
NSR	-- --	3/4	18

NSR

Typical NSR installation

Uses heavy gauge HRPO steel and a large surface area to distribute seismic forces on masonry exteriors.

Materials: 3/8" plate

Finish: USP primer

Options: See chart for Corrosion Finish Options

Installation:

- Install with a 3/4" diameter steel threaded rod.

USP Stock No.	Ref. No.	Corrosion Finish

Typical RP6 installation

STB / STBL Anchor Bolts

Embossed ends provide guides for embedment angle and depth. An embedment line is embossed on the shaft for easy installation. Features rolled threads for high tensile strength.

STB – For monolithic slabs and concrete stem walls.

STBL – Designed for use with 3x sill plates.
Excellent choice for use with taller holdown washers like those in the PHD series.

Materials: ASTM A 36 steel, also conforms to ASTM F1554 and ASTM A 307 requirements for bolts.

Finish: None

Options: See Chart for Corrosion Finish Options on page 33.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Typical STB Anchor Bolt installation

STB/STBL

**Plain view
along continuous stem wall installation**

**Plain view of corner of
stem wall installation**

**Plain view of
End of Stem Wall installation**

Monolithic or Stem Wall Foundations – Prior to pour, install the STB or STBL in an upright position and at a 45° angle to the wall. Install one horizontal #4 rebar at a depth of 4" (minimum). (See illustrations.)

Concrete Block Applications – Prior to cell pour, install the STB or STBL in an upright position and at a 45° angle to the wall. (See illustrations.) Use the embossed angle guide on the end of the STB or STBL shaft as a guide. Install one horizontal #4 rebar at a depth of 4" and one vertical #4 rebar maximum 48" o.c. spacing. Fill all cells with concrete having a minimum 2,500 psi compressive strength.

Installation:

- Select appropriate STB or STBL Anchor Bolt.
- Use normal weight concrete with minimum compressive strength of 2,500 psi.
- Minimum center-to-center spacing between bolts is 3(E) for anchors acting simultaneously in tension.
- Match embedment depth with embedment line on the STB or STBL shaft.
- The STB or STBL does not need to be tied to the rebar.
- Nuts and washers are not included.

**Typical STB/STBL
concrete block installation**

1) Loads may not be increased for short term loading.

2) Minimum center to center spacing between bolts is 3(E) for anchors acting in tension simultaneously.

3) Minimum edge distance is 1-3/4".

4) Concrete stemwall shall be a minimum of 6" thick for 5/8" anchor bolts and 8" for 7/8" anchor bolts.

5) End distance shall be no less than 5".

6) Connection is limited by lowest of bolt or holdown capacity.

7) Concrete block shall be minimum 10" block.

New products or updated product information are designated in **blue font**.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

Anchor bolts are used to secure wood plates to foundation walls. Washers are available in various package combinations.

Materials: Bolt: ASTM F 1554, Nut: ASTM A 563, Washers: ASTM F 844

Finish: AB126-HDG, AB128-HDG, AB1212-HDG,
AB5812-HDG – Hot-dip galvanized; All others – None

Installation:

- Select appropriate AB or ABP Anchor Bolt.
- Use concrete with minimum compressive strength of 2,500 psi at 28 days.
- Nuts and washers are included.
- Anchor bolts intended for use to satisfy code prescribed anchoring of mudsill plates, and shall be installed as defined in the code.
- Factored resistance shall be derived in accordance with the code.

Typical AB128-HDG installation

ABP

AB128-HDG

FT – Connect 1x and 2x nominal form lumber in low foundation walls up to 4 feet high.

WG – V-shaped wedge assures rigidity and consistent form spacing.

Materials: FT – 18 gauge, WG – 14 gauge

Finish: G90 galvanizing

Installation:

- Use the Spacing Guide chart to determine spacing between FT units. Each level in chart assumes 12" form boards. Wall thickness from 6" to 12".
- Install with "V" facing up.
- Use (2) WG wedges for each tie. Insert wedge into inside slots for 1x nominal forms and outside slots for 2x nominal forms.
- No walers or stiff-backs are used.
- Vertical ties to keep forms from separating are not included.
- Form deflection may be substantial. Check deflection, if it is critical, and move ties to compensate.
- Forming lumber is assumed to have fb of 1,000 psi.
- **Not recommended for pours greater than 4 feet in height.**

USP Stock No.	Ref. No.	Steel Gauge	Dimensions (in)		Wedge		Footings Width or Wall Thickness (ft)
			W	L	Qty	Type	
FT6	WT6	18	5/8	10-5/8	2	WG	6
FT8	WT8	18	5/8	12-5/8	2	WG	8
FT10	WT10	18	5/8	14-5/8	2	WG	10
FT12	WT12	18	5/8	16-5/8	2	WG	12
WG	W1	14	11/16	3-5/8	---	---	---

1) May be used with either 3/4-in or 1-1/2-in forming materials.

2) Breaking strength is approximately 775 pounds ultimate. Space as necessary to prevent form blow-out.

Spacing Guide Chart

Concrete Lift Height (in)	Level 1		Level 2		Level 3		Level 4	
	1x	2x	1x	2x	1x	2x	1x	2x
12 or Less	2' 6"	4' 0"	---	---	---	---	---	---
12 - 24	1' 6"	3' 0"	2' 6"	4' 0"	---	---	---	---

36 - 48	0' 9"	1' 6"	1' 0"	2' 0"	1' 6"	3' 0"	2' 6"	4' 0"

1) Factor of safety against tensile failure of tie is 1.5 or more.

Typical FT/WG
installation

WG Wedge
must order separately

RKS Kwik Strip Ties

For foundation applications where rental forms are used. Ease of form wall erection and removal makes this system very practical and economical. Use Kwik Strip Ties to hold form walls parallel, to prevent bulging and to prevent them from collapsing while concrete is being poured. 2 x 4 studding is not required for form work.

Materials: 16 gauge Cold Roll

USP Stock No.	Ref. No.	Steel Gauge	Dimensions (in)		Footings Width or Wall Thickness
			W	L	
RKS200	---	16	3/4	12-1/8	approximates 8-in

RKS

Typical RKS installation

FA3 Foundation Anchor

For installation into concrete slabs. The FA3 features a split flange for nailing to both mudsill and stud for greater framing versatility.

Materials: 16 gauge

Finish: G90 galvanizing

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Use a minimum of two anchors per mudsill. An anchor should always be within 12" of the end of each mudsill section.
- Do not rely on these anchors to secure concrete sections together between cold joints.
- Insert into wet concrete (minimum strength of 2,500 psi). Place mudsill after concrete cures. Secure flanges to sill (and stud, if applicable), bending flanges as needed to achieve a tight fit. Fasten as directed in chart.
- Do not use in red clay brick.

Typical FA3 installation to mudsill and stud

1) Predrilled holes are not required.

2) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase is allowed.

3) FA3 capacities are based on using a single-ply 2x sill plate.

4) Factored resistances are based on a minimum stemwall thickness of 6-inches.

5) Minimum anchor spacing for full capacity is 8 inches. For spacing less than that reduce capacity proportionally.

6) Minimum concrete strength f'c = 2500 psi

7) **NAILS:** 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long.

Corrosion Finish

- Stainless Steel
- Gold Coat
- HDG
- Triple Zinc

The FA4 foundation anchors can be installed as a replacement for the 5/8" diameter anchor bolts or also the commonly used 1/2" diameter anchor bolts while achieving the same load carrying capacity.

Materials: 16 gauge

Finish: G90 galvanizing

Options: See chart for Corrosion Finish Options

Installation:

- The FA4 can be mounted to the form board before placing the concrete or inserted into the wet concrete after it is poured. See Detail A installation.
- Place the mudsill in position after the concrete cures. Secure the FA4 to the mudsill (and stud, if applicable) by bending the flanges as needed for a tight fit and nailing into place with the size and quantity of fasteners specified in the chart.

ST1-TZ – For installation into concrete slab or poured stemwalls.

The ST1-TZ features a prebent base flange to assure proper anchoring into concrete.

ST2-TZ – For installation into concrete slab, poured stemwalls or concrete/masonry.

The ST2-TZ features a prebent base flange to assure proper anchoring into concrete.

Materials: 18 gauge

Finish: G-185 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Use a minimum of two anchors per mudsill. An anchor should always be within 12" of the end of each mudsill section.
- Do not rely on these anchors to secure concrete sections together between cold joints.
- Spread sill flanges to mudsill width prior to insertion into wet concrete (minimum strength of 2,500 psi, 13.8 MPa). Alternate installation is possible by inserting unbent flanges through 3/4" center hole predrilled in mudsill. Foundation anchors may also be attached to mudsill and then inserted into wet concrete. When installing ST2-TZ into concrete block, fill cells with grout with a minimum strength of 2,500 psi or 13.8 MPa. Concrete block edges may need to be beveled to facilitate installation.
- ST2-TZ in masonry construction shall be installed in the core of the block and grouted with concrete grout designed for that purpose. In no case, shall they be installed in a mortar joint.
- Do not use in red clay brick.

Typical ST1-TZ installation in concrete

Alternate ST1-TZ installation with 3/4" center hole

DO NOT install ST1-TZ and ST2-TZ without pre-bending sill flanges in "Y" configuration

ST1-TZ

ST2-TZ

Alternate ST2-TZ installation with 3/4" center hole in mudsill

Plate Size	USP Stock No.	Ref. No.	Steel Gauge	Fastener Schedule ²			Min. Embed (E) (in)	Unit	DF			S-P-F			Corrosion Finish

								kN	4.45	3.02	4.47	3.80	2.60	3.83	

1) Short term load duration has been taken into consideration. No increase allowed.

2) **NAILS:** 8d x 1-1/2 nails are 0.131" diameter by 1-1/2" long.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

SFA – Mudsill anchors for retrofit applications. Features a slotted bend line for easy adjustment when foundation walls are slanted.

SFJA – Ties floor joists directly to foundations with bolt fastening.

Materials: 12 gauge

Finish: G90 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- A design professional must specify anchor bolt type, length, and embedment. Anchor bolts are laterally loaded. Follow installation instructions for epoxy adhesive.
- Factored resistances assume a minimum concrete compressive strength of 2,500 psi.
- Bolts must be ordered separately.

Typical SFA8 installation

Typical SFJA installation

SFA8

SFJA

USP Stock No.	Ref. No.	Steel Gauge	Fastener Schedule						DF		S-P-F	
			Anchor Bolts		Framing				Factored Resistance ¹		Factored Resistance ¹	
					Nails ³		Bolts ²

SFA8	-- --	12	2	1/2	7	10d x 1-1/2	-- --	-- --	1085	-- --	915	-- --

1) The 115% values are short-term loads such as wind and earthquake.

2) Bolts shall conform to ASTM A 307 or better.

3) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long.

WT Wall Ties

Materials: 22 gauge

Finish: G90 galvanizing; WT22B-HDG – Hot-dip galvanized

Options: See chart for Corrosion Finish options

Installation:

- Use nails appropriate for intended use. See Product Notes, page 15.
- The opposite end must be bonded in the mortar joint of brick facade.
- Meets prescriptive requirements of CSA A370 for corrugated strip ties.

1" space between
brick and sheathing

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

KGLB – Single bolt, bearing only.

KGLBT – Double bolt with Structural Tee provides uplift and horizontal resistance.

KHGLB – Double bolt design provides uplift and horizontal resistance.

Materials: Flanges – 1/4" steel

Bearing Plate – See chart for "T" dimension

Anchor dowels – 3/4" x 12" rebar

Finish: USP primer

Options: Consult USP for non-catalog variations.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Bolt holes shall be a minimum of 1/32" to a maximum of 1/16" larger than the bolt diameter.
- Concrete or masonry walls must be checked by a design professional for adequacy to resist lateral or uplift loads transferred from the beam seat anchor.
- Bolts must be ordered separately. See page 17 for available sizes.

Typical KGLB installation

1) Beams must fully bear on plates.

2) Factored bearing resistances are based on the bearing value listed times the bearing area equal to W x D.
(Note that full bearing plate area is not used.) Factored bearing resistances shall be reduced where limited by wood bearing on the plate.

3) Factored bearing resistances on concrete are based on factored bearing strength in compression perpendicular to grain (ϕ_{fc}) of 662 psi and actually beam width times beam bearing length.

4) Designer shall specify minimum edge and spacing requirements in masonry or concrete structure.

5) Concrete or masonry support structure is assumed adequate to support loads listed.

1) Beams must fully bear on plates.

2) Factored bearing resistances on concrete are based on factored bearing strength in compression perpendicular to grain (ϕ_{fc}) of 662 psi and actually beam width times beam bearing length.

3) The 115% values are short-term loads such as wind and earthquake and are based on bolt in wood values only. Factored resistances assume concrete or masonry structure is adequate to resist loads in those directions.

4) Factored resistances must be reduced if the allowable lateral load (F₂) for masonry or concrete column governs.

5) Designer shall specify minimum edge and spacing requirements in masonry or concrete structure.

Connects girder beams to foundation walls and eliminates the need to block out pockets or inserts while forming foundation.

Materials: 12 gauge

Finish: USP primer

Options: Consult USP for non-catalog design variations.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- H dimension assumes 2x mudsill. For 3x or larger mudsill, please contact factory.
- The 1-1/2" hole, centered in the saddle, allows for installation over any protruding foundation bolts. This is not required.
- Placement of a wood sill over the top of the KGH top flange is required to achieve factored resistance.

Typical KGH installation

1) Factored download resistances shall not be increased for short-term load duration.

2) Placement of a wood sill over the top of the KGH top flange is required to achieve listed factored download resistances.

3) **NAILS:** 16d nails are 0.162" dia. x 3-1/2" long.

New products or updated product information are designated in **blue font**.

Specialty Options Chart –

refer to Specialty Options pages 220, 222-223 for additional details.

Option	Skewed ^{1,2}	Saddle
Range	1° to 45°	-- --
Factored Resistance	100% of table load.	100% of table load per side.
Ordering	Add SK, angle required, right (R) or left (L), and square cut (SQ) or bevel cut (BV) to product number. Ex. KGH46-6_SK45R_BV	Add SA, and saddle width required to product number. Ex. KGH46-6_SA=5-1/2"

1) Skewed hangers with skews greater than 15° may have all joist nailing on outside flange.

2) For skewed hangers, the required cut type (square or bevel) of joist member may vary based on skew angle and width of hanger. Some square cut hangers will require custom pricing due to welded back plate.

KGH saddle

Adjustable Support Columns may be used to support carport roofs and beams carrying loads not more than two wood frame floors, where the length of joists carried by such beams does not exceed 16' and a live load on any floor does not exceed 50 lbs/ft².

Materials: 3 gauge steel plates (3-1/2" x 6"); 12 gauge outer tube (2-3/4" O.D.); 11 gauge inner tube (2-1/2" O.D.)

Finish: Grey Primer Paint

Codes: Conforms to NBC 2010, Article 9.17.3.4.(1) and to CAN/CGSB-7.2-94.

Installation:

- Elevate top tubing to approximate height and insert locking pin. Rotate jack screw to desired height, then fasten top plate in position. Ensure top and bottom plates are properly fastened to supported beam members and properly aligned to the supported base footing. Always ensure product is installed 90° to beam and footing.
- Fasten the supported beam to the top plate with two (2) 1/4" x 2" lag screws.**

JP

Typical JP installation

USP Stock No.	Ref. No.	Adjustable Height		Allowable Load ^{1,3}		Factored Resistance ^{2,3}	
		in	mm	Lbs	kN	Lbs	kN
JP24	-- --	17 - 24	432 - 610	8555	38.06	12320	54.80

T2JP Type 2 Adjustable Support Columns

Type 2 Adjustable Support Columns are designed and tested to meet or exceed the CAN/CSB-7.2-94 Adjustable Steel Columns standard.

Materials: Top & Bottom Plates (4-1/2" x 6") – 3 gauge
 T2JPLD Tube (2-1/2" x 2-1/2") – 11 gauge
 T2JPMD Tube (3" x 3") – 10 gauge
 T2JPHD Tube (3" x 3") – 8 gauge

Finish: T2JPLD & T2JPHD Tube – Powder-Coated Red Paint
 T2JPMD Tube – Powder-Coated Black Paint
 Plates – Grey Primer Paint

Installation:

Turn threaded collar to extend the column to the desired height.

Secure the top plate to wood beam with four (4) 1/4" x 2" lag screws.

- Ensure column is installed in a vertical and plumb position.
- Column base shall be aligned and secured to a proper supporting slab.
- Top plate shall cover the full width of the supported beam. Beam shall be centered on the top plate and continuous across the entire length of the plate.

1) The Allowable Load values have been determined thru testing standards prescribed in the National Research Council Evaluation Directive for Adjustable Steel Columns using a safety factor of 2.25.

2) The Factored Resistance (ΦPn) values are established in accordance with the Canadian Standards Association S16, Design of Steel Structures, using a Resistance Factor Φ = 0.90.

3) The bearing resistance of the supported beam should be checked by the building designer using the appropriate CSA standard.

New products or updated product information are designated in **blue font**.

Adjustment assembly

Square tube design

Universal plate

- **HEAVY DUTY ADJUSTMENT ASSEMBLY FOR MAXIMUM LOADS**
- **MODULAR DESIGN FOR GREATEST JOB SITE FLEXIBILITY**
- **SQUARE POST FOR EASY AND ACCURATE CUT DOWN**
- **USE REBAR/ROD THROUGH 9/16" HOLE FOR HEIGHT ADJUSTMENT**

T2TP Type 2 Top Plates

Type 2 Top Plates are compatible with Type 2 Adjustable Support Columns and provide additional bearing for Structural Composite Lumber (SCL) beams and dimensional lumber. They are easily placed and aligned on top of the standard steel column top plate supplied with each USP Type 2 column and can be quickly fastened to the supported beam.

T2TP527 – 5-1/4" bearing width (Typical: 3 ply 1-3/4" LVL or 6x beam)

T2TP79 – 7" bearing width (Typical: 4 ply 1-3/4" LVL or 8x beam)

Materials: 3 gauge ASTM A 36 steel

Finish: USP primer

Installation:

- Place Top Plate on top of standard Type 2 Top Plate.
- Align holes in Top Plate with holes in standard Type 2 Top Plate.
- Install appropriate lag screws through stacked top plates into bottom of supported beam.
- T2TP shall cover the full width of the supported beam. Beam shall be centered on the T2TP and continuous across the entire length of the plate.

T2TP79
(T2TP527 similar)

Typical T2TP79 installation
(T2TP527 similar)

USP Stock No.	Ref. No.	Steel Gauge	Dimensions (in)		Fastener Schedule		DF		S-P-F	
			W	L	Qty	Type	Factored Resistance		Factored Resistance	
							Bearing (100%)		Bearing (100%)	
							Lbs	kN	Lbs	kN
T2TP527	--	3	5-1/4	7	4	1/4" x 2" Lag Screw	29300	131.3	22600	101.3
T2TP79	--	3	7	9	4	1/4" x 2" Lag Screw	38500	172.6	34000	152.4

- Factored resistances are for standard term loading; reduce or increase for other load durations in accordance with the code.
 - Bearing loads are based on compression perpendicular to grain values published in the Canadian Standards Association [CSA-086-14](#) and having the top plate in full contact with the supported member.
 - Factored resistances are based on lumber with a specific gravity of DF = 0.49 and S-P-F = 0.42 and a moisture content of 19% or less.
 - Lag Screws are not supplied. WS2 Wood Screws (1/4" dia. x 2" long) may be ordered separately and used in lieu of lag screws.
 - Beams shall be designed to support the required loads. Beam shear may limit loads to less than listed loads for device.
 - The factored resistance of the T2TP may exceed the column capacity. Refer to the Type 2 Column load tables for the maximum factored resistance based on column length.
- New products or updated product information are designated in [blue font](#).

T2CC Type 2 Column Caps

Cap only version for Type 2 Adjustable Support Columns. Adds bearing capacity and resists beam rotation.

Materials: T2CC35: 7 gauge ASTM A1011; T2CC525, T2CC71: 3 gauge ASTM A 36 steel

Finish: USP primer

Installation:

- Replaces standard Type 2 Top Plate.
- Slide column cap tube into top of existing threaded pipe component for complete adjustability.
- WS3 Wood Screws, 1/4" dia. x 3" long, are supplied with T2CC Column Caps.
- Beam shall be continuous across the entire length of the column cap.

T2CC35

Typical T2CC installation

USP Stock No.	Ref. No.	Steel Gauge	Dimensions (in)			Fastener Schedule ⁴		DF Factored Resistance		S-P-F Factored Resistance	
			W	H	L	Beam		Bearing (100%)		Bearing (100%)	
						Qty	Type	Lbs	kN	Lbs	kN
T2CC35	--	7	3-5/8	6-1/2	11	16	WS3	31270	139.1	23675	105.3
T2CC525	--	3	5-1/4	8	13	16	WS3	54115	240.7	40970	182.2
T2CC71	--	3	7-1/8	6-1/2	11	16	WS3	62540	278.2	47350	210.6

- Factored resistances are for standard term loading; reduce or increase for other load durations in accordance with the code.
 - Bearing loads are based on compression perpendicular to grain values published in [CSA 086-14](#) and having the bucket base in full contact with the supported member.
 - Factored resistances are based on lumber with a specific gravity of DF-L = 0.49 and S-P-F = 0.42 and a moisture content of 19% or less.
 - WS3 Wood Screws (1/4" dia. x 3" long) are included with T2CC Column Caps.
 - Beams shall be designed to support the required loads. Beam shear may limit loads to less than listed loads for device.
 - The factored resistance of the T2CC may exceed the column capacity. Refer to the Type 2 Column load tables for the maximum factored resistance based on column length.
- New products or updated product information are designated in [blue font](#).

Reduces eccentricity in the studs/post with decreased centerline dimension. No thru-bolts to countersink.

Materials: See chart.

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- **Place the PHD/PHDA over the anchor bolt. No washer is required.**
- Install with USP's code evaluated WS3 (1/4" x 3") Wood Screws, which are provided with the holdown.
- Tighten anchor bolt nuts finger tight, snug, to base, plus 1/3 to 1/2 additional turns with a wrench.
- **PHD/PHDA Predeflected Holdowns may be installed off sill plate with no load reduction.**
- The design engineer may specify any alternate anchorage calculated to resist the tension load for a specific application. Anchorage exposure length should take the bearing plate height of 1-5/8" into account, anchor bolt thread should visibly extend above nut.
- If used to anchor a built-up post, such as a double 2 x 4, the post component shall be designed to act as a single unit. Holdown fasteners specified shall not be considered to attach multiple plies together.
- For anchorage options see STBL Anchor Bolt section on pages 32-33.

Typical PHD5A installation

PHD8

PHD5A

USP Stock No.	Ref. No.	Steel Gauge	Dimensions (in)				Fastener Schedule				Unit	DF Factored Resistance	S-P-F Factored Resistance
			W	H	D	CL ⁶	Anchor Bolts ²		Wood Screws ⁴			Uplift 115% ^{1,5}	Uplift 115% ^{1,5}
							Qty	Dia.	Qty	Type

											kN	24.02	20.17
PHD5A	HDU5-SDS2.5	14	3	11-11/16	2-5/8	1-3/8	1	5/8	14	WS3	Lbs	6755	5670
											kN	30.05	25.22
PHD8	HDU8-SDS2.5	12	3-1/4	16-1/2	3	1-3/8	1	7/8	24	WS3	Lbs	8470	7115
											kN	37.68	31.65

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) The designer must specify anchor bolt type, length, and embedment.

3) The PHD/PHDA may be elevated off the sill.

4) WS3 wood screws are 1/4" x 3" and are included with PHD/PHDA models.

5) Minimum post thickness is 3". Consult USP for installations less than 3".

6) "CL" denotes the distance between the post and center of the anchor bolt.

The DTB-TZ Deck Tie Back provides positive anchorage between the deck framing and the exterior wall. When used in conjunction with USP triple-zinc or gold-coat joist hangers, the DTB-TZ transfers the lateral loads into the exterior wall while the joist hangers support the vertical loads. The DTB-TZ can also be used to reinforce the connection between the rail post and the deck.

Finish: G-185 galvanizing

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Install with USP's THR 1/2" threaded rod or equivalent.
- Position DTB-TZ on deck joist in a location where the 1/2" threaded rod or bolt may be threaded through the bolt hole.
- Drive WS15-HDG wood screws into joist.
- Re-install threaded rod or anchor bolt. Secure with washer and nut.
- Tighten anchor bolt nuts finger tight, snug, to base plus 1/3 to 1/2 additional turns with wrench.

Typical DTB-TZ installation

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) WS15-HDG Wood Screws are 1/4" dia. x 1-1/2" long and are included with DTB-TZ Deck Tie-Backs.

New products or updated product information are designated in **blue font**.

Corrosion Finish  Stainless Steel  Gold Coat  HDG  Triple Zinc

LTS series – The LTS19 is designed for nail-on installation to 2x joists or studs, and the LTS20B provides a nail or bolt fastening option. The LTS20B will accommodate wood I-Joists if 10d x 1-1/2" nails are used instead of the specified 16d nails.

LTTI31 – An open web joist tension tie designed for use with masonry or concrete construction.

Materials: See chart

Finish: G90 galvanizing; LTS19-TZ — G-185 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners to attach the strap portion of the connector to the side of stud, post, joist, purlin, or beam. Secure the base to the concrete or masonry wall with specified anchor bolt. A design professional shall specify the type, length, and embedment of the anchor bolt. No washers required.
- Washers are not required on transfer plates that fit over the anchor bolt.
- LTTI31 and LTS connectors must be mounted flush to the surface of the masonry.
- Factored resistances are based on either nail or bolt fastening; nail and bolt values cannot be combined.
- Tighten anchor bolt nuts finger tight, snug, to base plus, 1/3 to 1/2 additional turns with a wrench.
- Bolts must be ordered separately.

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) 16d sinkers may be substituted for the specified 10d common nails with no load reduction.

3) The designer must specify anchor bolt type, length and embedment depth.

4) LTTI and LTS holdowns shall be installed tight to the sill plate.

5) **NAILS:** 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.

New products or updated product information are designated in **blue font**.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

Secures multi-ply studs or posts to mudsills or foundation. Nail fastening makes for a convenient connection to studs or posts in cramped retrofit installations.

Materials: 10 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners to attach the strap portion of the connector to the side of stud, post, joist, purlin, or beam. Secure the base to the concrete or masonry wall with specified anchor bolt. A design professional shall specify the type, length, and embedment of the anchor bolt.
- HTT45 Max – Fill all round and diamond nail holes.
- Washers are not required on transfer plates that fit over the anchor bolt.
- Tighten anchor bolt nuts finger tight snug to base plus, 1/3 to 1/2 additional turns with a wrench.

Typical HTT16 installation

Typical HTT45 Max installation

2) 16d sinkers may be substituted for the specified 10d common nails with no load reduction.

3) The designer must specify anchor bolt type, length and embedment depth.

4) **NAILS:** 10d nails are 0.148" dia. x 3" long, 16d x 2-1/2" nails are 0.162" dia. x 2-1/2" long.

New products or updated product information are designated in **blue font**.

TD – Different welded configurations and sizes achieve a great deal of versatility within the TD series.

TDX – The TDX2 and TDX5 feature formed designs, all others are welded. All are self-jigging.

All models, except TD2, TD5, and TD7, feature a self-jigging design with code required end distances built in.

Materials: See chart

Finish: TDX2-TZ – G-185 galvanizing; All others – USP primer

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Do not use lag bolts. Washers are not required for anchor bolts or between holdown and bolt hex head, but standard washers should be used against stud or post under the nut. See page 34 for BP/LBP Bearing Plates.
- Bolt holes should be a minimum of 1/32" to a maximum of 1/16" larger than the bolt diameter.
- See pages 32-33 for STB Anchor Bolt section for anchorage options. A design professional may specify alternate anchorage with conventional anchor bolts.
- A design professional shall determine the adequacy of the stud to resist published loads. When installing to multi-ply 2x studs, the designer must specify the fasteners required to bind the plies together and resist splitting.
- Tighten anchor bolt nuts to finger tight, plus 1/3 to 1/2 additional turns with a wrench. Wood members may shrink over time; if possible, nut tightness should be checked periodically.
- If used to anchor a built-up post, such as a double 2 x 4, the post component shall be designed to act as a single unit. Holdown fasteners specified shall not be considered to attach multiple plies together.
- Bolts must be ordered separately.

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) The designer must specify stud or post to resist published factored resistance.

3) The designer must specify anchor bolt type, length, and embedment.

4) All models may be installed with greater than the required anchor end distance with no chart load reduction.

5) The designer shall consider the effect of compression, bearing, tension, and combined bending due to device eccentricity when applicable.

6) Holdowns raised off of the sill plate may have higher deflection values.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

Sources of Deflection at the Shear Wall Holdown Connections

The following are some of the sources of deflection that should be evaluated by the designer. See the illustration, which applies to other holdown configurations.

- A. Improperly-sized stud/post bolt holes** – increased bolt slip can occur if stud/post bolt holes are oversized and exceed the NDS® recommended bolt hole diameter.
- B. Stud/Post bolt holes** – bolt slip can occur.
- C. Wood crushing at stud/post bolt hole perimeters** – the use of larger washers/bearing plates can reduce stress-induced wood crushing at bolt bearing locations.
- D. Eccentricity in stud/post caused by holdown** – holdowns installed on only one side of a stud or post result in an eccentricity which causes increased stresses and movement in a shear wall system.
- E. Nut spin** – anchor bolt nuts that are not restrained can spin loose during cyclic loading, allowing movement; the use of steel nylon locking nuts or thread adhesive may prevent nut spin.
- F. Loose nuts** – increased movement can occur when nuts are not sufficiently tightened.
- G. Holdown deflection** – holdown deflection can occur when the shear wall system is subjected to cyclic stress from earthquakes or high wind.
- H. Wood Shrinkage** – due to drying, wood may shrink and cause bolted connections to become loose; periodic retightening may be required.
- I. Localized crushing at wood-bearing surfaces** – excessive crushing at wood-bearing surfaces may result from compressive forces due to overturning during high wind or earthquake loading.

Standard Installation

Alternative Installation

Engineered for high capacity with minimum deflection and low eccentricity.

Materials: See chart

Finish: USP primer

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Place holdown over anchor bolt and drive screws into post.
- Tighten anchor bolt nuts finger tight snug to base, plus 1/3 to 1/2 additional turns with a wrench.
- Holdown may be installed off of the plate with no load reduction.
- Post may be shimmed provided the shim acts as a single unit with the post. Holdown fasteners specified shall not be considered to attach shim to post. Shim shall be a structural material equal or better than the post material. Consult a designer or an engineer of record for appropriate fastening of shim.

Alternate installations:

- Drill hole in concrete or masonry and insert retrofit anchor (i.e. epoxy anchor) capable of resisting uplift and lateral loading.
- Place holdown over anchor bolt and drive screws into post.
- Tighten anchor bolt nuts finger tight snug to base, plus 2-3 additional turns with a wrench.
- Post may be shimmed provided the shim acts as a single unit with the post. Holdown fasteners specified shall not be considered to attach shim to post. Shim shall be a structural material equal or better than the post material. Consult a designer or an engineer of record for appropriate fastening of shim.

1) Short-term load duration factor $K_D = 1.15$ has been taken into consideration; no further increase allowed.

2) The UPHD may be installed elevated off the sill.

3) Where post is consisted of multiple 2x members, members must be fastened securely together to act as one member.

4) UPHD hold-down shall be installed centered along the width of the post.

5) The designer must specify anchor bolt type, length, and embedment.

6) WS3 wood screws are 1/4" x 3" and are included with UPHD models.

New products or updated product information are designated in **blue font**.

Designed to anchor wood framing to poured concrete foundations.

Materials: See chart

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Bending the strap horizontally 90° to facilitate wall placement may cause concrete behind the embedded strap to break away at the top edge (spalling). If the spall is 1" or less from the top edge of the concrete, no load reduction is necessary. If the spall is between 1" and 4", the factored resistance is 0.90 of the published chart load.
- When installing on lumber less than 3-1/2" wide, wood splitting may occur. To reduce splitting, use 10d x 1-1/2" nails or fill every other hole with 16d common nails. Reduce factored resistance in accordance with code requirements.
- Straps are to be installed at the edge of concrete. Install prior to pour by nailing to form. Drive temporary nails through lowest two nail holes into form. Concrete level should reach embedment line; minimum embedment depths are listed in chart.
- Do not rely on these straps to secure concrete sections together between cold joints; take other measures to transfer the load. If there is a cold joint between slab and foundation, the minimum embedment must be made into the foundation. Fastening opportunities may be reduced because the slab pour level may be higher than some nail holes. Using fewer fasteners will reduce factored resistance. Reduce factored resistance by the code capacity for each fastener not installed.
- Factored resistances based on a minimum concrete compressive strength of 2,500 psi at 28 days, with one #4 horizontal rebar in the shear cone. Rebar should be a minimum length of 2x embedment depth plus 12" (see chart for exceptions in corner installations).
- Where fewer fasteners are used in the structural wood member, reduce loads according to the code.
- There may be an increase in the amount of deflection if the strap is installed on the outside of the sheathing, versus directly to the framing members.
- Strap may be bent one complete cycle to aid installation.

										1.5 x I _E	Uncracked	4675	20.80	3495	15.55
											Cracked	3275	14.57	3275	14.57

1) A 16d Common nail has a diameter of 0.162 inch and a length of 3-1/2 inches.

2) Predrilled holes are not required.

3) An edge distance of 1/2" implies that the distance from the corner of the wall to the edge of the strap is no less than 1/2".

4) An edge distance of 1.5 x I_E implies that the minimum distance from the corner of the wall to the centerline of the strap is no less than 1.5 times the embedment depth.

5) For edge distances between 1/2" and 1.5 x I_E calculate loads using straight line interpolation.

6) Minimum anchor spacing for full capacity is 2 x I_E. For spacing less than that reduce capacity proportionally.

7) Factored resistances are based on lumber with a specific gravity of 0.49 for DF and 0.42 for S-P-F with a moisture content of 19% or less.

8) Minimum concrete strength f'c = 2500 psi

9) Minimum 1-#4 rebar shall be installed in the shear cone

HPAHD

PAHD42

The coined dimples below the embedment line allow for increased concrete bonding. These holdowns retain high uplift capacity even when installed at corners of foundation stemwalls. Ideal for use with built up 2x end posts.

RJ after the model indicates LSTAD or STAD for rim joist applications as in STAD8RJ. Rim joist models provide for a 17" clear span without the loss of strap nailing.

Materials: LSTAD - 14 gauge; STAD - 12 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15. The bottom (2) nails are for form board attachment only and do not contribute to fastener schedule requirements.
- Embed holdown in concrete to the embedment line (bend line).
- See illustrations for requirements on rebar, edge distances, and clear spans.
- Bending the strap horizontally 90° to facilitate wall placement may cause concrete behind the embedded strap to break away at the top edge (spalling). If the spall is 1" or less from the top edge of the concrete, no load reduction is necessary. If the spall is between 1" and 4" the factored resistance is 0.90 of the published chart load.
- When installing on lumber less than 3-1/2" wide, wood splitting may occur. "To reduce splitting, use 10d x 1-1/2" nails or fill every other hole with 16d common nails. Reduce factored resistance per code requirements accordingly.
- These straps do not secure concrete sections together at cold joints; take other measures to transfer the load. If there is a cold joint between slab and foundation, the minimum embedment must be made into the foundation. Fastening opportunities may be reduced because the slab pour level may be higher than some nail holes. Using fewer fasteners will reduce factored resistance. Reduce factored resistance by the code capacity for each fastener not installed.
- To achieve full table loads the minimum center-to-center spacing is twice the embedment depth (I_E) when resisting tension loads at the same time.
- Where fewer fasteners are used in the structural wood member, reduce loads according to the code.
- There may be an increase in the amount of deflection if the strap is installed on the outside of the sheathing, versus directly to the framing members.
- Strap may be bent one complete cycle to aid installation.

1) Factored resistances have been increased 15% for short-term load duration; no further increase is allowed.

2) 10d common (0.148" x 3" long) nails may be substituted with no load reduction.

3) Wood thickness shall be no less than 2".

4) The 115% values are short-term loads such as wind and earthquake.

5) RJ after the model indicates LSTADs for rim joist applications as in LSTAD8RJ.

6) Interpolate allowable loads for edge distances between those listed. Nail quantities may be reduced for less than I_E corner distance design loads- use the code allowable loads for fasteners in shear.

7) Where fewer fasteners are used in the structural wood member, reduce loads according to the code.

8) **NAILS:** 16d Sinker nails are 0.148" dia. x 3-1/4" long.

1) Predrilled holes are not required.

2) When 16d Sinker nails are specified, 10d common (0.148" diameter x 3" long) nails may be substituted with no load reduction.

3) Short-term load duration factor 115% for wind and earthquake has been taken into consideration; no further increase is allowed.

4) Wood thickness shall be no less than 3 inches (2 - 2x members).

5) Factored resistances are based on a minimum stemwall thickness of 6-inches.

6) Corner strap location implies that the distance from the corner of the wall to the edge of the strap is no less than 1/2".

7) Middle strap location implies that the minimum distance from the corner of the wall to the centerline of the strap is no less than

1.5 times the embedment depth (l_e).

8) For edge distances between 1/2" and 1.5 x le calculate loads using straight line interpolation.

9) Minimum anchor spacing for full capacity is $2 \times l_e$. For spacing less than that reduce capacity proportionally.

10) Minimum concrete strength $f'_c = 2500$ psi

11) Minimum 1-#4 rebar shall be installed in the shear cone

12) NAILS: 16d Sinker nails are 0.148" dia. x 3-1/4" long.

New products or updated product information are designated in **blue font**.

Foundation Straps offer an economical, one-piece method of achieving a continuous load path from a 2 x 8, 2 x 10, 2 x 12, or 2 x 14 rim joist through concrete block to foundation. All models require a 6" embedment into concrete footings.

Materials: 12 gauge

Finish: G90 galvanizing

Options: See Chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Factored resistances are based on either nail fastening or bolt fastening; nail and bolt values cannot be combined.
- Install by inserting product into footing's wet concrete. All models require a 6" embedment into concrete foundations. Courses of concrete block must be laid over connector. Notch mudsill at connector locations. Wrap strap over rim joist and fasten.
- Do not rely on these straps to secure concrete sections together between cold joints; take other measures to transfer the load. If there is a cold joint between block and foundation, the minimum embedment must be made into the foundation.
- Based on product embedment the exposed number of fastener holes may be reduced. Using fewer fasteners will reduce factored resistance. Reduce factored resistances by the code prescribed factored resistance per fastener, for each fastener not installed.
- Factored resistances are based on a minimum concrete compressive strength of 2,500 psi at 28 days.
- Bolts must be ordered separately.

Typical TA installation

1) Bolt values are for 3" thick rim joist loaded perpendicular to grain.

2) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase is allowed.

3) Factored uplift resistance for bolted connections based on upper most fastener 1-1/2" from top of rim board.

4) Nails: 16d x 2-1/2 nails are 0.162" diameter by 2-1/2" long.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

PA series – For installation into poured concrete or concrete block walls and foundations.

PAI series – For wood I-Joist applications. An expanded 3" on-center nail spacing reduces splitting along I-Joist flange.

Materials: 12 gauge

Finish: G90 galvanizing

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Minimum concrete strength is 2,500 psi.
- The factored resistance for bolts are based on parallel to grain loading with a 3" minimum member thickness. Reduce load per code requirements when minimum member thickness is not achieved.
- Minimum concrete edge distance is 4" for PA & PAI series.
- Minimum concrete block edge distance is 20".
- Designer may specify alternate fastening schedules. Refer to Nail Specification Table on page 18 for nail shear values. Load values shall not exceed published factored resistances.
- No anchor bolts are needed for achieving efficient stress transfer from framing to concrete walls or foundations.
- Bolts must be ordered separately.

Typical PAI I-Joist purlin face installation

- 1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.
- 2) Values for bolts are based on parallel-to-grain loading with 3" minimum member thickness.
- 3) Values are based on the use of either nails or bolts; nail and bolt values cannot be combined.
- 4) 16d sinkers or 10d common nails may be substituted for the specified 16d common nails at 0.85 of the table loads.
- 5) For alternate nail schedule and load values consult USP.
- 6) Minimum quantity of fasteners to be installed. Product may have additional fastener holes not needed to meet published factored resistance of product.
- 7) **NAILS:** 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 16d nails are 0.162" dia. x 3-1/2" long.

Corrosion Finish

- Stainless Steel
- Gold Coat
- HDG
- Triple Zinc

TDL Concrete Angles

These angles secure wood posts to concrete or wood floors in light-duty applications.

Materials: 12 gauge

Finish: G90 galvanizing

Options: See Chart for Corrosion Finish Options.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- The TDL10 can be embedded into concrete. Minimum embedment depth is 4" to achieve factored resistances.
- **Moisture barrier may be required.**
- Bolts must be ordered separately.

**Typical TDL5
interior installation**

**Typical TDL10
embedded interior
installation**

TDL10

								1	1/2	1140	5.07	980	4.36	

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) Values given are based on the use of either nails or bolts; nail and bolt values cannot be combined.

3) The bolt values are based on single shear with a minimum member thickness of 3-1/2".

4) Designer must specify anchor bolt type, length, and embedment.

5) **NAILS:** 16d nails are 0.162" dia. x 3-1/2" long.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

Post Anchors are used to secure wood posts to concrete footings. These post anchors also provide moisture damage protection and feature a 1" stand-off plate to elevate wood posts above concrete surfaces.

Materials: See chart

Finish: G90 galvanizing, PA66ER-TZ - G-185 galvanizing

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. Install with supplied washer.
- Anchor bolts and nails are not furnished.
- **Not recommended for fence posts or other unrestrained (not fixed or fastened at top) applications. These anchors are not designed to resist overturning (moment) loads.**
- **Anchor bolt installation** – position specified diameter anchor bolt at desired location with minimum 4" embedment into minimum 2,500 psi concrete. A minimum 2" edge distance is required to achieve factored resistance.
- **For hardened concrete or retrofit installations** – use specified diameter threaded rod with USP's CIA-EA or CIA-GEL 7000-C adhesive epoxy, following installation instructions. Contact USP Engineering for further information on selecting the proper epoxy.
- Bolts must be ordered separately.

Corrosion Finish

 Stainless Steel
  Gold Coat
  HDG
  Triple Zinc

WAS – A formed base providing a 1" stand-off with high bearing capacity.

WE – A formed, one-piece design. Includes embossing for additional lateral strength.

Materials: See chart

Finish: G90 galvanizing

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Insert into wet concrete after the pour. For the **WE**, embed the anchor so that the base plate is flush with the surface of the concrete. For the **WAS**, embed the anchor until the concrete surface meets the bottom edge of the stand off base legs. This will provide a 1" stand-off where required. A 2" minimum edge distance is required to achieve factored resistance.
- **Not recommended for fence posts or other unrestrained (not fixed or fastened at top) applications. These anchors are not designed to resist overturning (moment) loads.**
- Bolts must be ordered separately.

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake;

reduce for other load durations in accordance with the code.

2) H2 is minimum embedment length of anchor into concrete.

3) Minimum concrete compressive strength shall be 2,500 psi at 28 days.

4) Factored resistances are based on the use of either nails or bolts; nail and bolt values cannot be combined.

5) **NAILS:** 16d nails are 0.162" dia. x 3-1/2" long.

These post bases allow installers to pre-align posts and preset post heights above concrete floors or footings. By eliminating post-to-concrete contact, moisture damage is reduced. Elevated post bases are ideal for building carports, decks or porches. All series feature convenient nail fastening to post.

Materials: EPB – 14 gauge tube; 12 gauge steel U-bracket
 EBG44 – 16 gauge tube; 16 gauge steel U-bracket
 EPBH – 12 gauge steel U-bracket Stem – 15 mm rebar

Finish: EPB – USP primer; EBG44-TZ – G-185 galvanizing, EPBH–Hot-dip galvanized

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- **Not recommended for fence post or other fixed post applications. These anchors are not designed to resist overturning (moment) loads.**
- Maintain 3" minimum edge distance between embedded tube and edge of concrete.

1) Factored lateral resistances (F1 and F2) are for conditions where pipe extends no more than 1" above the concrete surface.

2) Factored uplift and lateral resistances have taken short-term load duration factor 115% into consideration, no further increase is allowed.

3) **NAILS:** 16d nails are 0.162" dia. x 3-1/2" long.

New products or updated product information are designated in **blue font**.

Corrosion Finish

- Stainless Steel
- Gold Coat
- HDG
- Triple Zinc

APB Height Adjustable Post Bases

Allows height adjustments of post after installation. A maximum height adjustment of 4" can be achieved with this product. Adjustments may be required if original installation is not exact, if there is a greater slope on a deck than estimated, or if there is heaving or sinking of the post beyond the initial installation. Embed in concrete a minimum of 6". Useful for reducing moisture damage.

Materials: 16 gauge tube; 12 gauge steel U-bracket

Finish: Hot-dip galvanized

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- **Not recommended for fence posts or other unrestrained (not fixed or fastened at top) applications. These anchors are not designed to resist overturning (moment) loads**

Typical APB installation

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) Concrete compressive strength shall be 2,500 psi or greater at 28 days.

3) **NAILS:** 16d HDG nails are 0.162" dia. x 3-1/2" long and hot-dip galvanized per ASTM A 153.

New products or updated product information are designated in **blue font**.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

High capacity column base fastens to column with WS wood screws.

Materials: See chart

Finish: G90 galvanizing

Options: KCBQ models available in rough/full sizes
See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- WS2 Wood Screws, 1/4" dia. x 2" long, are supplied with KCBQ Column Bases.
- **Not recommended for fence posts or other unrestrained (not fixed or fastened at top) applications. These bases are not designed to resist overturning (moment) loads.**
- All models require a minimum edge distance of 3".
- Embed column base with bottom of base plate flush to concrete.

Typical KCBQ66 installation

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) Concrete compressive strength shall be 2,500 psi or greater at 28 days.

3) WS2 Wood Screws are 1/4" x 2" long and are included with KCBQ Column Bases.

4) "Specify" denotes the required width that must be specified at the time of ordering.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

These column bases install using USP's WS2-HDG Wood Screws, reducing installation time and cost. Designed for high uplift in high wind or seismic applications. Includes a stand-off plate to protect the wood from ground contact moisture.

Materials: See chart

Finish: G-185 galvanizing

Options: See chart for Corrosion Finish Options

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- WS2-HDG Wood Screws, 1/4" dia. x 2" long, are supplied with CBSQ Bases.
- Maintain 3" minimum edge distance between embedded tube and edge of concrete.
- Embed the column base until the concrete surface meets the bottom edge of the stand-off plate.
- **Not recommended for fence posts or other unrestrained (not fixed or fastened at top) applications. These bases are not designed to resist overturning (moment) loads.**

Typical CBSQ44-TZ installation

1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) WS2-HDG Wood Screws are 1/4" x 2" and are included with CBSQ Column Bases.

3) Concrete compressive strength shall be 2,500 psi or greater at 28 days.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

12 gauge base for carports, patios, or other residential framing.

Materials: 12 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- **Not recommended for fence posts or other unrestrained (not fixed or fastened at top) applications. These bases are not designed to resist overturning (moment) loads.**
- All models require a minimum edge distance of 3".
- Bolted models feature diamond holes for temporary nail fastening to facilitate drilling and bolting.
- Embed column base with bottom of base plate flush to concrete.
- Bolts must be ordered separately.

Typical CBE installation

									12	16d	4060	18.06	3490	15.52

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) All bolts shall meet or exceed the specifications of ASTM A 307.

3) Concrete compressive strength shall be 2,500 psi or greater at 28 days.

4) Factored resistances are based on the use of either nails or bolts; nail and bolt values cannot be combined.

5) CBE column base shall be embedded into concrete up to this depth.

6) **NAILS:** 16d nails are 0.162" dia. x 3-1/2" long.

New products or updated product information are designated in **blue font**.

Secures nominal sized posts to wood surfaces for light-duty applications.

Materials: See chart

Finish: G90 galvanizing; D44-TZ & D46R-TZ - G-185 galvanizing;
 RSCH – Hot-dip galvanized

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- **Not recommended for fence posts or other unrestrained (not fixed or fastened at top) applications. These anchors are not designed to resist overturning (moment) loads.**
- While D series post anchors offer some lateral and uplift resistance, they are not recommended as a primary means of anchorage for posts in railings. They may be used only for intermediate posts between fully anchored corner / end posts in rail systems.

Typical D installation

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

BC – One-piece design for double 2x's to a 4x post.

BCS – One-piece design connects 2-ply or 3-ply beams to the tops of 4x4 or 6x6 post. Slant nailing reduces the amount of nails required.

C – One-piece design.

Materials: 18 gauge

Finish: G90 galvanizing;

BC400-TZ – G-185 galvanizing

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Typical BC400-TZ installation

Typical BCS23-6 installation

Typical C44 installation

Installation:

- Place post cap on top of post and fasten cap to post using specified nails.
- Place beam between top flanges of the cap and install all specified nails into beam.
- BCS** - Slant nails must be installed through dimple holes at a 30° to 45° angle through the beam into the post to achieve listed loads. **Standard length "common" nails must be used to achieve listed load values.**

1) Short-term load duration factor $K_D = 1.15$ has been taken into consideration; no further increase allowed.

2) **NAILS:** 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long. New products or updated product information are designated in **blue font**.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

PB – Two-piece design.

PBES / PBS – Two-piece design with extended side plates and wrap around post design. Easy retrofit installations.

Materials: 18 gauge

Finish: G90 galvanizing; PB44-6TZ &

PB66-6TZ – G-185 galvanizing

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- These products are designed for single, solid-sawn beams with matching post width. Multi-ply beams must have same width as post. Use shims as required.
- **PB, PBES, PBS post caps are to be installed in pairs.**

**Typical PBS
installation**

**Typical PBES
installation**

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) Factored resistances and nail schedules for two-piece models are per pair of post caps.

3) **NAILS:** 16d nails are 0.162" dia. x 3-1/2" long.

Corrosion Finish  Stainless Steel  Gold Coat  HDG  Triple Zinc

PBC Post Beam Corner Connectors

The PBC series is a one-piece connector designed to secure two mitered beams on a corner post while providing uplift capacity.

Materials: 18 gauge

Finish: G-185 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Install PBC on outside corner of post forming tabs to inner side of post.
- Assumes beam members are bevel cut at corner.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

CPB Composite Post Bases

The CPB is made of corrosion resistant composite material compatible with preservative treated lumber. Provides code required 1" stand-off and can be used with rough lumber sizes.

Materials: High Strength composite

Installation:

- Attach base to post with (4) 10d HDG nails.
- Attach post to concrete using 1/2" diameter rod into concrete and extend into wood member.
- **Not recommended for fence posts or other unrestrained (not fixed or fastened at top) applications. These anchors are not designed to resist overturning (moment) loads.**

Post Size	USP Stock No.	Ref. No.	Dimensions (in)		Bottom Surface Bearing Area	Fastener Schedule ⁵		Factored Resistance ^{1,2}		Concrete Bearing Strength ^{3,4}	
			W1	W2		Qty	Type	Lbs	kN	Lbs	kN

1) Loads shall not be increased for short-term loading.

2) Loads require a minimum 650 psi wood compressive strength.

3) Concrete Design Bearing Strength = $\phi (0.85 f'_c A_1)$ with $f'_c = 2,500$ psi. ACI 318-02, Section 10.17.1.

4) Design Bearing Strength has been increased assuming $(A_2 / A_1)^{0.5}$ per ACI 318-02, Section 10.17.1.

5) **NAILS:** 10d nails are 0.148" dia. x 3" long.

Designed to be installed without the need to drill bolt holes, simplifying installation and maintaining the wood cross section. Installs with WS Wood Screws offering high uplift capacity.

KCCQ — Standard column cap.

KECCQ — End column cap.

Materials: See chart

Finish: USP primer

Options: See chart for Corrosion Finish Options and Specialty Options on page 73.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- WS3 Wood Screws, 1/4" dia. x 3" long, are supplied with Column Caps.
- Beams shall be designed to support the required loads. Beam shear may limit loads to less than listed loads for device. A design professional shall determine the adequacy of the stud to resist published loads.

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) Bearing loads are based on compression perpendicular to grain values published in the 2001 NDS and soft converted to Limit States Design.

3) Factored resistances are based on lumber with a specific gravity of DF = 0.49 and S-P-F = 0.42 and a moisture content of 19% or less.

4) WS3 Wood Screws are 1/4" x 3" long and are included with KCCQ and KECCQ column caps.

5) Beams shall be designed to support the required loads. Beam shear may limit loads to less than listed loads for device.

6) The designer shall check post for required loads.

7) Spliced conditions must be detailed by the specifier to transfer tension loads between spliced members by means other than the column cap.

8) Uplift loads do not apply to splice conditions.

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) Bearing loads are based on compression perpendicular to grain values published in the 2001 NDS and soft converted to Limit States Design.

3) Factored resistances are based on lumber with a specific gravity of DF= 0.49 and S-P-F = 0.42 and a moisture content of 19% or less.

4) WS3 Wood Screws are 1/4" x 3" long and are included with KCCQ and KECCQ column caps.

5) Beams shall be designed to support the required loads. Beam shear may limit loads to less than listed loads for device.

6) The designer shall check post for required loads.

7) Spliced conditions must be detailed by the specifier to transfer tension loads between spliced members by means other than the column cap.

8) Uplift loads do not apply to splice conditions.

New products or updated product information are designated in **blue font**.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

Specialty Options:

- **KECCQ** – Straps may be rotated 90° on special order where the W2 dimension is less than or equal to the W1 dimension.
- **KCCQO/KECCQO** – Cap only, no strap design for field welding to pipe or other columns.
- **KCCQOB** – For cross beam connections. Any two buckets can be welded together for a wide variety of applications. Factored resistance shall be the lesser of the two components.
- **KCCQT** – For T beam intersections, consult USP. Specify beam/column conditions, dimensions, and loading requirements.
- **KCCQC** – For X beam intersections, consult USP. Specify beam/column conditions, dimensions, and loading requirements.
- **KECCQLL/R** – For L beam intersections, consult USP. Specify left (L) or right (R) beam/column conditions, dimensions, and loading requirements.

Dimension call-outs not shown in the table must be specified at time of ordering for specialty options, non-catalog, or rough/full size lumber sizes.

Refer to Options for Multiple-Beam Bolted Column Caps Special Order Worksheet for ordering instructions at www.uspconnectors.com/resources/technical-bulletins.

MP – 18 gauge. Field adjustable from 0° to 135°.

A3 – 18 gauge. Eliminates toenailing and increases strength.

AC – 16 gauge. Features staggered nail patterns which reduces wood splitting and allows installation on both sides of the supported member.

JA – 14 or 16 gauge. Heavier capacity framing angle for joist support.

Materials: See chart

Finish: G90 galvanizing

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- MP Framing Angles are fabricated at 100° and may be field adjusted by hand from 0° to 135°. Bend angle only once.

1) Factored resistances are shown per angle, and may be doubled if installed in pairs. When using a single angle, joist must be constrained from rotation.

2) For 1-1/2" lumber where 10d nails are specified, use 10d x 1-1/2" nails and apply 0.90 adjustment factor to the table value.

3) NAILS: 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.

New products or updated product information are designated in blue font.

ML angles are multi-purpose angles that install easily with USP's WS15 wood screws. The staggered fastener pattern allows for back-to-back installations.

Materials: 12 gauge

Finish: G-185 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- USP WS15 (1/4" x 1-1/2") are not supplied with ML angles.

**Typical ML26-TZ
installation
(ML24-TZ similar)**

**ML26-TZ
(ML24-TZ similar)**

									kN	8.41	9.68	5.96	6.87	

1) Factored resistances have been increased 15% for short-term, duration loading; no further increase allowed.

2) USP's WS15 Wood Screws are 1/4" diameter x 1-1/2" long and are not included with angles.

3) For exterior applications use WS15-HDG screws with the hot-dip galvanized finish.

RBC Roof Boundary Clip

Framing plate designed to connect roof blocking to a wall top plate.

Materials: 20 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Field adjustable from 0° to 90°.
- **Bend angle only once.**

**Typical RBC top-plate to
outside of blocking installation**

**Typical RBC top-plate to

					Wood to CMU	3	1/4" Tapcon	6	10d x 1-1/2	735	3.27	525	2.34

1) Loads shown are for a single roof boundary clip.

2) Use ITW Buildex 1/4" x 1-1/2" Tapcon fasteners; or equal, installed in accordance with manufacturer's specification.

3) **NAILS:** 10d x 1-1/2 nails are 0.148" diameter by 1-1/2" long.

MP34 – Framing angle without tabs.

MPA1 – Tabs enable two and three-way connections.

MP4F – Connects 2x framing with floor sheathing up to 5/8".

MP6F – Connects 3x framing with floor sheathing up to 3/4".
 Better choice for connections where floor sheathing is between sole plate and rim board.

Materials: See chart

Finish: G90 galvanizing

Options: See chart for Corrosion Finish Options on page 77.

Codes: Load values are derived from data submitted to various North American building code evaluators.

HH44

The LJC-TZ and LJQ-TZ Lateral Joist Connectors transfer lateral loads at the top foundation to the floor joists. The fastening patterns meet I-joist manufacturer recommendations.

LJC-TZ – fastens the top side of the sill plate to the underside of the floor joist preventing splitting of the bottom chord flanges, and can be installed after the floor system has been installed. The product is load rated for use with dimension lumber floor joists as well as I-joist. It can also be used with cantilevered floor joists.

LJQ-TZ – is a higher capacity connector designed for higher loads. It is similar in design to a joist hanger with a seat for the floor joist to bear against and utilizes wood screws to fasten to the sill plate. USP's WS15-HDG Wood Screws (included) provide quick installation without the need to predrill holes.

Materials: See chart

Finish: G-185 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- **LJC-TZ** – Installs after the floor joist has been placed with a minimum of (12) 8d x 1-1/2" HDG nails.
- **LJQ-TZ** – Installs with (4) USP WS15-HDG Wood Screws. WS15-HDG Wood Screws are 1/4" diameter x 1-1/2" long and are included with LJQ-TZ connectors.

Coiled strapping enables cut-to-length convenience for a variety of immediate job site needs.

CMST – 3" wide strapping features diamond nail holes to provide nailing options and reduce wood splitting.

CMSTC – 3" wide strapping is designed for high load conditions. Engineered to reduce wood splitting.

RS – 1-1/4" wide strapping packaged in cartons containing 25-foot or longer coils.

Materials: See chart

Finish: G90 galvanizing

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

**Typical RS
rim joist installation
CMST similar**

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- For safety, always wear gloves when handling or cutting coiled strapping.
- **CMST** installations: Install to a minimum 2 ply 2x edge. Increase nail spacing if wood begins to split.
- Designer may specify alternate nailing schedules. Refer to **Nail Specification Table** on page 18 for nail shear values. Load values shall not exceed published factored resistance.

HRS – 12 gauge, 1-3/8" or 3-1/4" wide strapping.

LSTA – 20 or 18 gauge, light-capacity 1-1/4" wide strapping.

LSTI – 3-3/4" wide strap ties provide tension load path for truss top chords. The nail pattern accommodates open web trusses with double top chord.

MSTA – 18 or 16 gauge, medium-capacity 1-1/4" wide strapping.

HTP – 16 gauge, medium-capacity 3" wide strapping.

ST – 16 gauge, medium-capacity 1-1/4" wide strapping.

MSTC – 3" wide strapping. Slotted hole design allows for higher load capacities and reduces splitting of lumber when attached to multiple 2x members.

KST – 3/4", 1-3/4", or 2-1/16" wide strapping. Straps can be fastened using either nails or bolts. Some KST straps install only with nails.

KSTI – 2-1/16" wide strapping. Straps are designed for installation to wood I-Joist flanges.

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) Total number of nail and/or bolt holes provided in the strap.

3) Minimum quantity of fasteners to be installed with equal fasteners at each end of the connection. Strap may have additional nail holes not needed to meet published factored resistance of strap.

4) Factored resistances are based on parallel-to-grain loading, minimum of 2-1/2" thick.

5) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.

Typical KST237 floor-to-floor installation

Designed for notched plates where plumbing, heating, or other pipes are placed in partitions.

Materials: 16 gauge

Finish: G90 galvanizing

Options: See chart for Corrosion Finish Options

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Install one strap tie for each 2x plate.

**Typical KRPS
installation**

KRPS

USP Stock No.	Ref. No.	Steel Gauge	Dimensions (in)		Notch Width (in)	Fastener Schedule ³		DF Factored Resistance		S-P-F Factored Resistance		Corrosion Finish
			W	L		Qty	Type	Tensile 115% ^{1,2}		Tensile 115% ^{1,2}		
								Lbs	kN	Lbs	kN

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) Factored resistances are based on single shear, parallel to grain loading with a 3-1/2" minimum member thickness.

3) **NAILS:** 16d nails are 0.162" dia. x 3-1/2" long.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

MSTCB Pre-Bent Straps

The MSTCB Pre-Bent Strap is designed to fasten vertical studs to a beam or ridge beam member below where the beam depth will not allow complete fastener attachments with a standard product.

Materials: 14 gauge

Finish: G90 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.

**Sideview Typical MSTC66B3
installation**

MSTCB

USP Stock No.	Ref. No.	Steel Gauge	Dimensions (in)			Min. Beam Dimensions (in)		Fastener Schedule ⁵						Unit	DF	S-P-F
			W	L	B	W	D	Beam				Stud/Post ^{2,3,4}			Factored	Factored
								Face		Bottom					Resistance	Resistance
								Qty	Type	Qty	Type	Qty	Type		Tensile	Tensile
														115% ¹	115% ¹

														kN	31.96	22.69
MSTC66B3	MSTC66B3	14	3	62-7/8	2-7/8	3	11-1/4	14	10d	4	10d	24	10d	Lbs	7185	5100
														kN	31.96	22.69

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) Minimum strap length on stud/post for quantity of nails is 19" for MSTC48B3 and 22" for MSTC66B3.

3) Fewer fasteners in the stud/post than listed will reduce the capacity of the connection.

4) Nails in the stud/post to be installed symmetrically in pairs starting a minimum of 1-1/2" from the end.

5) **NAILS:** 10d nails are 0.148" dia. x 3" long.

Connects permanent wood foundation studs to rim joist to resist lateral loads produced from ground pressure. The high load values and positive placement nail gun installation make the PWFS24 practical for manufactured homes as well as site built homes.

Materials: 20 gauge

Finish: G90 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Center strap on top plate over the stud.
- Attach center nail and bend inside end of strap downward.
- Install nails on inside of wall.
- Install floor system or place manufactured home on foundation.
- Form outside end of strap up the outside of rim and install nails.

Typical PWFS24 installation

PWFS24

USP Stock No.	Ref. No.	Steel Gauge	Dimensions (in)		Fastener Schedule ²		DF Factored Resistance		S-P-F Factored Resistance	
			W	L	Qty	Type	Tensile 100% ¹		Tensile 100% ¹	
							Lbs	kN	Lbs	kN
PWFS24	PWF24	20	1-1/2	24	9	8d	1115	4.96	930	4.14

1) For installations where the strap does not fall behind joist, the designer shall be responsible to determine suitability of rim to resist the load.

2) **NAILS:** 8d nails are 0.131" dia. x 2-1/2" long.

HTW / KTS / LFTA / LTW / MTW Twist Straps

Twist straps tie framing members to resist tension forces.

LFTA6 – 16 gauge.

LTW – 18 gauge, light-capacity.

MTW – 16 gauge, medium-capacity.

KTS – 16 gauge, medium-capacity with angled twist.

HTW – 14 gauge, heavy-capacity.

Materials: See chart

Finish: G90 galvanizing

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Consult I-Joist manufacturer for web stiffener requirements, and uplift limitations on joist and application.

- Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.
- 16d sinker nails may be substituted for 10d common nails with no reduction in load.
- For 1-1/2" lumber, where 16d nails are specified, use 10d x 1-1/2" nails and apply 0.78 adjustment factor to the table value.
- Fasteners shall be distributed equally on each end of the connection.
- C after the model number designates center twist as in MTW30C.
- LFTA6: F1 is 870 lbs DF-L and 775 lbs S-P-F. To achieve F1 lateral loads, three nails must be installed on each side on the strap located closest to the bend line. Lateral F1 load direction does not apply to roof truss-to-top plate installations.
- NAILS:** 8d x 1-1/2" nails are 0.131" dia. x 1-1/2" long, 8d nails are 0.131" dia. x 2-1/2" long, 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.

Corrosion Finish

- Stainless Steel
- Gold Coat
- HDG
- Triple Zinc

The MSTAM and MSTCM Strap Ties are designed to connect a wood structure above to a masonry wall below.

Materials: See chart

Finish: G90 galvanizing

Options: See chart for Corrosion Finish Options

Installation:

- Use all specified fasteners. See Product Notes, page 15.

Typical MSTCM40 installation

MSTCM40

Typical MSTAM36 installation

1) Use ITW Buildex 1/4" x 2-1/4" Tapcon fasteners; or equal, installed in accordance with the manufacturer's specification.

2) Factored resistances are derived from tests performed using hollow C90 concrete block.

3) **NAILS:** 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.

The HTWM Twist Straps are designed for truss to concrete or masonry connections. Offer uplift resistance with variable heel height and positioning applications.

Materials: 14 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, pages 15.
- Strap may be attached to either side of grouted masonry or concrete wall with a minimum of (1) 15M horizontal rebar.
- Drill hole in concrete or masonry with manufacturer's prescribed 1/4" masonry drill. Install fasteners into concrete or masonry per manufacturer's specification.
- Grout or concrete compressive strength shall be 2,500 psi at 28 days.
- Twist straps do not have to be wrapped over the truss to achieve the factored resistance.
- Moisture barrier may be required.

Typical HTWM installation

HTWM

USP Stock No.	Ref. No.	Steel Gauge	Dimensions (in)			Fastener Schedule						Unit	DF Factored Resistance ¹	S-P-F Factored Resistance ¹
			W	L	L1	CMU ²		Concrete ²		Truss/Rafter ³			Tensile 115%	Tensile 115%

												kN	6.76	5.94

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) Use Powers Fasteners 1/4" x 1-3/4" Wedge-Bolt®; or equal, installed in accordance with manufacturer's specification.

3) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long.

JA Joist Anchors

The JA Joist Anchor is designed to laterally connect a joist to a concrete wall. The anchor is embedded into the wall at one end and nailed to the joist at the strap end, typically used where there is a fire separation wall such as in town houses.

JA Joist Anchor is not designed to carry gravity load or to resist uplift force. Vertical loads (gravity and/or uplift) shall be accommodated by other means.

Materials: 7 gauge

Finish: None

Installation:

- The "L" end of the anchor is to be embedded into a poured concrete wall.
- Minimum embedment is 6" which measures from the embedded end to the end of the twist.
- Deeper embedment may be required to allow for code required 2-1/2" end distance for the first joist fastener depending on joist anchor size and header thickness.
- Fasten the strap portion of the JA Joist Anchor to the horizontal joist using all specified nails.
- **Connectors are not load rated.**

JA1224

Typical JA1224 installation

USP Stock No.	Ref. No.	Steel Gauge	Dimensions (in)			Fastener Schedule ¹

1) UMH factored resistance values are based upon 2,500 psi.

- Represents common applications and product configurations. Consult USP for additional applications and/or optional product configurations.
- New products or updated product information are designated in **blue font**.

USP offers a wide variety of light-gauge face mount joist hangers to accommodate application and installation preferences.

ST series – 22 gauge, 2x joist hangers.

DT series – 22 gauge, (2) 2x joist hangers.

JL series – 20 gauge, 2x joist hangers.

JLIF series – 18 gauge, 2x joist hangers.

SUH series – 16 gauge steel construction for more demanding applications and light truss support.

Materials: See chart

Finish: G90 galvanizing; JLIF – G-185 galvanizing

Options: See chart for Corrosion Finish Options.

See SUH Specialty Options Chart.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners.
See Product Notes, page 15.

SUH Specialty Options Chart

Refer to Specialty Options pages 220-221 for additional details.

Option ⁴	Skewed ^{1,3}	Sloped Seat ^{2,3}	Sloped / Skewed ^{1,2,3}
Range	1° to 67-1/2° when width is 1-3/4" or less. 1° to 50° on all others.	1° to 45°	See Sloped Seat and Skewed
Factored Resistance	100% of table load. 75% of uplift load on skews greater than 15°.	100% of table load	80% of table load. 75% of uplift load on skews greater than 15°.
Ordering	Add SK angle required, right (R) or left (L), and square cut (SQ) or bevel cut (BV) to product number. Ex. SUH210_SK45R_SQ	Add SL, slope required, and up (U) or down (D), to product number. Ex. SUH210_SL30D	See Sloped Seat and Skewed. Ex. SUH210_SK45R_SQ_SL30D

1) Skewed hangers with skews greater than 15° may have all joist nailing on outside flange.

2) Sloped or sloped / skewed hangers with slopes greater than 15° may have additional joist nails.

3) For skewed hangers, the required cut type (square or bevel) of joist member may vary based on skew angle and width of hanger. Some square cut hangers will require custom pricing due to welded back plate.

4) SUH option hangers may be manufactured as welded products to achieve listed loads. Welded products will have primer finish.

New products or updated product information are designated in **blue font**.

Typical ST
installation

Typical DT
installation

ST

DT

The HUS, JUS & MUS hanger series offers double shear nailing. USP's dimple allows for 30° to 45° nailing through the joist into the header resulting in higher loads and less nailing. Slant nailing also eliminates the need for shorter joist nails in 2x applications.

Materials: JUS - 18 gauge; MUS - 18 gauge; HUS - 14 or 16 gauge

Finish: G90 galvanizing

Options: See Chart for Corrosion Finish Options. See HUS Specialty Options Chart.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Joist nails must be driven at a 30° to 45° angle through the joist or truss into the header to achieve listed loads. **Standard length "double shear" nails must be used to achieve listed load values.**
- JUS & MUS - 16d sinkers (0.148" dia. x 3-1/4") may be used where 10d commons are specified with no load reduction.

**Typical HUS46
installation**

**Typical JUS26
installation**

HUS Specialty Options Chart

Refer to Specialty Options pages 220-221 for additional details.

Option	Inverted Flange
Range	Not available in widths less than 2-1/4".
Factored Resistance	100% of table load. 65% of table load when nailing into the support members end grain.
Ordering	Add <i>IF</i> to product number. Ex. HUS410_IF

**Typical HUS410IF
inverted flange
installation**

HD Heavy-Duty Face Mount Hangers

HD hangers are heavy-duty face mount hangers that can be used to support headers, joists, and trusses.

Materials: 14 gauge

Finish: G90 galvanizing

Options: See chart for Corrosion Finish

Options. All nominal lumber sizes are available rough/full size lumber. See Specialty Options Chart.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Some HD models feature nail holes along bend line that must be filled to achieve factored resistance. Verify proper header width to accomplish this for inverted models.

Specialty Options Chart

Refer to Specialty Options pages 220-221 for additional details.

Option	Skewed ^{1,3}	Sloped Seat ^{2,3}	Sloped / Skewed ^{1,2,3}	Inverted Flange
Range	1° to 67-1/2° when width is 1-3/4" or less. 1° to 50° on all others.	1° to 45°	See Sloped Seat and Skewed	Not available in widths less than 2-1/4"
Factored Resistance	100% of table load. 75% of uplift load on skews greater than 15°.	100% of table load	80% of table load. 75% of uplift load on skews greater than 15°.	100% of table load. 65% of table load when nailing into the support members end grain.
Ordering	Add SK, angle required, right (R) or left (L), and square cut (SQ) or bevel cut (BV) to product number. Example: HD410_SK45R_SQ	Add SL, slope required, and up (U) or down (D), to product number. Example: HD410_SL30D	See Sloped Seat and Skewed Example: HD410_SK45R_SQ_SL30D	Add IF, to product number. Example: HD410_IF

1) Skewed hangers with skews greater than 15° may have all joist nailing on outside flange.

2) Sloped or sloped / skewed hangers with slopes greater than 15° may have additional joist nails.

3) For skewed hangers, the required cut type (square or bevel) of joist member may vary based on skew angle and width of hanger. Some square cut hangers will require custom pricing due to welded back plate.

4) HD option hangers may be manufactured as welded products to achieve listed loads. Welded products will have primer finish. New products or updated product information are designated in blue font.

1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) 16d sinkers (0.148 dia. x 3-1/4" long) may be used at 0.86 of the table load where 16d commons are specified. This does not apply to JUS, HUS, MUS slant nail hangers.

3) **NAILS:** 8d x 1-1/2" nails are 0.131" dia. x 1-1/2" long, 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.

New products or updated product information are designated in **blue font**.

1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) 16d sinkers (0.148 dia. x 3-1/4" long) may be used at 0.86 of the table load where 16d commons are specified. This does not apply to JUS, HUS, MUS slant nail hangers.

3) WS3 Wood Screws are 1/4" x 3" long and are included with HDQ hangers.

4) **NAILS:** 8d x 1-1/2" nails are 0.131" dia. x 1-1/2" long, 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.

1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.
2) 16d sinkers (0.148 dia. x 3-1/4" long) may be used at 0.86 of the table load where 16d commons are specified. This does not apply to JUS, HUS, MUS slant nail hangers.
3) WS3 Wood Screws are 1/4" x 3" long and are included with HDQ hangers.
4) **NAILS:** 8d x 1-1/2" nails are 0.131" dia. x 1-1/2" long, 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.
New products or updated product information are designated in **blue font**.

1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) 16d sinkers (0.148 dia. x 3-1/4" long) may be used at 0.86 of the table load where 16d commons are specified. This does not apply to JUS, HUS, MUS slant nail hangers.

3) WS3 Wood Screws are 1/4" x 3" long and are included with HDQ hangers.

4) **NAILS:** 8d x 1-1/2" nails are 0.131" dia. x 1-1/2" long, 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 16d nails are 0.162" dia. x 3-1/2" long.

New products or updated product information are designated in **blue font**.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) 16d sinkers (0.148 dia. x 3-1/4" long) may be used at 0.86 of the table load where 16d commons are specified. This does not apply to JUS, HUS, MUS slant nail hangers.

3) WS3 Wood Screws are 1/4" x 3" long and are included with HDQ hangers.

4) **NAILS:** 8d x 1-1/2" nails are 0.131" dia. x 1-1/2" long, 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long. New products or updated product information are designated in **blue font**.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

With a top mount design and heavy steel fabrication the KB and KLB hangers can cover medium-to-heavy beam and purlin applications. The top mount design offers high loads with less nailing than comparable face mount hangers.

KLB – 14 gauge

KB – 12 gauge

Materials: See chart

Finish: G90 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- NA20D nails are included with hangers where applicable.
- For welded installations, see page 224.
- **KB models are not recommended for use with LVL, PSL, or LSL members.**

Typical KB installation

KB

Typical KLB installation

KLB

HDO Heavy-Duty Top Mount Hangers

Primarily used to hang joists or headers in medium load conditions. These hangers provide higher load values with less nailing.

Materials: 12 gauge

Finish: G90 galvanizing

Options: All nominal lumber sizes are available for rough/full size lumber. See Specialty Options Chart.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Check top flange dimensions to ensure compatibility with header widths.
- **Do not use for welded or nailer applications. Reference Specialty Options chart below for hanger options.**

Specialty Options Chart

Refer to Specialty Options pages 220 and 222 for additional details.

Option	Skewed ^{1,3}	Sloped Seat ²	Sloped / Skewed ^{1,2,3}	Inverted Flange
Range	1° to 67-1/2° when width is 1-3/4" or less. 1° to 50° on all others.	1° to 45°	See Sloped Seat and Skewed	Not available in widths less than 3-1/8"
Factored Resistance	100% of table load. 75% of uplift load on skews greater than 15°.	100% of table load	80% of table load. 75% of uplift load on skews greater than 15°.	100% of table load. 65% of table load when nailing into the support members end grain.
Ordering	Add SK, angle required, right (R) or left (L), and square cut (SQ) or bevel cut (BV) to product number. Ex. HD0210_SK45R_SQ	Add SL, slope required, and up (U) or down (D), to product number. Ex. HD0210_SL30D	See Sloped Seat and Skewed. Ex. HD0210_SK45R_SQ_SL30D	Add IF to product number. Ex. HD0610_IF

1) Skewed hangers with skews greater than 15° may have all joist nailing on outside flange.

2) Sloped or sloped / skewed hangers with slopes greater than 15° may have additional joist nails.

3) **For skewed hangers, the required cut type (square or bevel) of joist member may vary based on skew angle and width of hanger. Some square cut hangers will require custom pricing due to welded back plate.**

New products or updated product information are designated in **blue font**.

HDO standard installation

HDO28-2

Typical HDO410IF inverted flange installation

Typical HDO skewed option installation

SW – Light-duty hanger.

SWH – Medium-duty hanger.

KHW – Heavy-duty hanger installs with NA20D nails for higher load capacities.

Materials: SW top flange - 12 gauge; stirrup - 12 gauge;

SWH top flange - 7 gauge; stirrup - 12 gauge;

KHW top flange - 3 gauge; stirrup - 10 gauge

Finish: USP primer

Options: All nominal lumber sizes are available for rough/full size lumber.

See Specialty Options below.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

• Use all specified fasteners. See Product Notes, page 15.

• NA20D nails are supplied with KHW hangers.

• For welded installations see page 224.

• **KHW models are not recommended for use with LVL, PSL, or LSL members.**

Nailer Installation Chart

Chart represents maximum factored resistance for hangers used on wood nailers. Reference page 127.

USP Stock No.	Nailer Size	Fastener Schedule ²				DF Factored Resistance		S-P-F Factored Resistance

SWH	2X	2	10d x 1-1/2	2	10d	2600	11.57	1970	8.76
	3X	2	16d x 2-1/2	2	10d	3350	14.90	2535	11.28
KHW	3X	4	16d x 2-1/2	2	10d	5180	23.04	3925	17.46

1) Listed loads shall not be increased.

2) **NAILS:** 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d x 2-1/2" nails are 0.162" dia. x 2-1/2" long.

New products or updated product information are designated in **blue font**.

Typical KHW46 installation

Typical SW210 installation

KHW46

SW210

SWH410

Specialty Options Chart – Refer to Specialty Options pages 220, 222-223 for additional details.

Option	Skewed ^{1,3}	Sloped Seat ²	Sloped / Skewed ^{1,2,3}	Sloped Top Flange ⁴	Top Flange Offset		Saddle	Ridge
Range	1° to 84°	1° to 45°	See Sloped Seat and Skewed	0° to 35°	-- --		-- --	0° to 45°
Factored Resistance	100% of table load	100% of table load	100% of table load	Reduce allowable table loads using straight-line interpolation	Hanger Width 3-1/2" or less 3-9/16" to 5-1/2" 5-9/16" to 7-1/2"	% of table load: 60% 75% 85%	100% of table load per side	100% of table load
Ordering	Add SK, angle required, right (R) or left (L), and square cut (SQ) or bevel cut (BV) to product number. Ex. SW212_SK45R_SQ	Add SL, slope required, and up (U) or down (D), to product number. Ex. SW212_SL30D	See Sloped Seat and Skewed. Ex. SW212_SK45R_SQ_SL30D	Add SF, angle required, and right (R) or left (L), to product number. Ex. SW212_SF30L	Add OS, and right (R) or left (L), to product number. Ex. SW212_0SL		Add SA, and saddle width required to product number. Ex. SW212_SA=5-1/2"	Add DA, angle required to product number. Ex. SW212_DA30

1) Skewed hangers with skews greater than 15° may have all joist nailing on outside flange.

2) Sloped or sloped / skewed hangers with slopes greater than 15° may have additional joist nails.

3) **For skewed hangers, the required cut type (square or bevel) of joist member may vary**

based on skew angle and width of hanger. Some square cut hangers will require custom pricing due to welded back plate.

4) Sloped top flanges with greater than 15° may have additional header nails.
New products or updated product information are designated in **blue font**.

HL Light Gauge Purlin Hangers

These top mount hangers are designed for supporting floor joists or 2x purlins. The top mount style allows builders to drop in joists or purlins quickly.

Materials: 18 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

• Use all specified fasteners. See Product Notes, page 15.

Typical HL210 installation

1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) HL and SW products do not provide uplift resistance, except for the HL214.

3) Refer to the respective Nailer Options chart on page 105 for hangers installed on wood nailers.

4) **NAILS:** 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.

New products or updated product information are designated in **blue font**.

1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) KHW products do not provide uplift resistance.

3) Refer to the respective Nailer Options chart on page 105 for hangers installed on wood nailers.

4) KHW Glulam load values are based on 560 psi perpendicular to grain loading.

5) **NAILS:** 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long and are included with KHW hangers.

New products or updated product information are designated in **blue font**.

1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) KHW products do not provide uplift resistance.

3) Refer to the respective Nailor Options chart on page 105 for hangers installed on wood nailers.

4) KHW Glulam load values are based on 560 psi perpendicular to grain loading.

5) Consult USP for additional Glulam sizes.

6) **NAILS:** 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long, NA20D nails are 0.192" dia. x 2-1/2" long and are included with KHW hangers.

New products or updated product information are designated in **blue font**.

The Fire Wall Hanger is designed for attaching truss, I-joist, solid sawn lumber, or engineered wood floor framing members to double wall top plates or minimum 2-ply 2x solid sawn header fire rated wood frame walls. The advanced design allows the installation of the FWH **before** the 5/8" gypsum wallboard (drywall) is attached and permits the building project to be completely framed-up, and weather-tight before the gypsum wallboard sheathing work starts.

Materials: 14 gauge

Finish: G90 galvanizing

Codes: Factored resistances are derived from data submitted to various North American building code evaluators

Options: See Specialty Options chart on page 110.

Installation:

- Install the face of hanger flanges tight to stud wall framing.
- For wall framing, hangers do NOT need to be installed at stud locations for full design values.
- The end of the truss/joist should measure 1-5/8" from the face of the supporting wall. See Figure 1.
- The truss/joist should bear fully on the FWH seat with a gap no greater than 1/8" between the end of the supported member and the hanger. See Figure 1.
- **Gypsum Wallboard Installation** - Use the FWH-T template to slot cut the gypsum wallboard. See FWH-T Template Installation Sequence on page 110. Slide the gypsum wallboard into position and fasten to the framing members meeting minimum requirements specified by code.

New products are designated in **blue font**.

**FWH****FWH-T
Template****2 Hour Fire-Rating**

FWH hangers are tested per ASTM E814 standards. When installed on one side of a maximum 2 hour fire-rated wall assembly, the penetration of the USP FWH Fire Wall Hanger through the gypsum wallboard will not reduce the fire resistive rating of the 2 hour fire resistive assembly.

Specialty Options Chart – Refer to Specialty Options pages 220 and 222 for additional details.

Option	Skewed ¹
Range	1° to 45°
Factored Resistance	80% of table load
Ordering	Add <i>SK</i> , angle required, right (<i>R</i>) or left (<i>L</i>), and square cut (<i>SQ</i>) to product number. Ex. FWH3514_SK45R_SQ

1) Skewed hangers with skews greater than 15° may have all joist nailing on outside flange.

1) Align the FWH-Template slot with the mark in the gypsum wallboard and engage the prongs into edge of gypsum wallboard

2) Rotate the template and press down on the end to engage the corner prongs

3) Run the gypsum wallboard cutter down the template to cut the slot

FWH-T template installation sequence

JH Multi-Purpose Joist Hanger

These strap-style hangers are designed to support trusses, joists, or purlins. JH models may be bent along the flange allowing builders to use the hangers in top mount, face mount, or combination applications.

Materials: 18 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Joist nails must be driven at a 30° to 45° angle through the joist or truss into the header to achieve listed loads. **Standard length “double shear” nails must be used to achieve listed load values.**
- If installing in top mount configuration, field bend top flange over header.
- 16d sinkers (0.148" dia x 3-1/4") may be used where 10d common are specified with no load reduction.

USP Stock No.	Ref. No.	Ga.	Dimensions (in)					Header Size	Fastener Schedule ^{2,3}					Unit	DF		S-P-F				
			W	H	D	B	TF		Header		Joist				Factored Resistance		Factored Resistance				
									Top Qty	Face Qty	Type	Qty	Type		Floor	Uplift ¹	Floor	Uplift ¹			
															100%	115%	100%	115%

							1-7/16	2 x 8	2	8	10d	6	10d	Lbs	4750	2415	3730	1900			
							7/16	2 x 10	2	12	10d	6	10d	Lbs	4750	2415	3730	1900			
							--	2 x 12	--	14	10d	6	10d	Lbs	4750	2415	3730	1900			

1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) Nails must be driven at a 30° to 45° angle through the joist or truss into header to achieve the table loads.

3) **NAILS:** 10d nails are 0.148" dia. x 3" long. 16d sinkers (0.148" dia. x 3-1/4" long) may be used where 10d commons are specified with no reduction in load. New products or updated product information are designated in **blue font**.

LS Light Slope Rafter Hangers

A field-adjustable seat gives the LS hanger application flexibility.

The LS hanger slopes from 0° to 30° down (0 to 7:12 pitch down).

Materials: 18 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- The LS can be field adjusted to slopes from 0° to 30° down.

2) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 16d nails are 0.162" dia. x 3-1/2" long.

New products or updated product information are designated in **blue font**.

RR Ridge Rafter Hanger

The RR Ridge Rafter supports rafter pitches up to 7:12 (30°). Nesting top flange for installation on 2x support beams.

Materials: 18 gauge

Finish: G90 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- The rafter end at the ridge must be plumb cut to achieve published loads.
- Optional diamond nail holes can be used to fasten RR to end of rafter before setting rafter into place.

Typical RR installation

USP Stock No.	Ref. No.	Steel Gauge	Min Rafter Size	Fastener Schedule ²					DF		S-P-F	
				Header		Rafter			Factored Resistance ¹		Factored Resistance ¹	
				Qty	Type	Qty	Type		Download	Uplift	Download	Uplift

				4	LL915	4	LL915	Lbs	705	345	500	245
								kN	3.14	1.53	2.22	1.09

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) **Nails:** 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, LL915 denotes a USP LumberLok Screw, #9 x 1-3/8" long.

New products or updated product information are designated in **blue font**.

LSSH Slope/Skew Hangers

The LSSH series connects rafters to ridge beams in vaulted roof structures. This series is field adjustable to meet a variety of skew and/or slope applications. Slopes and skews 0° to 45°.

Materials: See chart

Finish: G90 galvanizing; LSSH15-TZ – G-185 Galvanizing

Options: See Chart for Corrosion Finish Options

Codes: Factored resistances are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.

Steps:

1. Position LSSH connector against plumb-cut end of joist. Fasten joist side flanges on both sides with 10d (0.148") x 1-1/2" nails. Bend seat up to fit against joist bottom and drive (1) 10d (0.148") x 1-1/2" nail through bottom seat into rafter bottom. Drive (2) 10d (0.148") x 1-1/2" nails at downward angle through dimpled nailing guides.
 2. Lean connector and rafter end against ridge beam at desired position. Install specified 10d (0.148" x 3") or 16d (0.162" x 3-1/2") nails through nail holes into ridge beam at right 90° angle. If skewing the rafter, only drive nails into ridge beam on inside flange.
 3. Bend flange to desired angle.
 4. Hammer outside flange until edge touches header. Fasten outside flange to ridge by driving specified 10d (0.148" x 3") or 16d (0.162" x 3-1/2") nails through nail holes.
- Web stiffeners are required for all wood I-Joist installations.
 - Designer may consider adding a tension restraint for the supported member for roof slopes exceeding 6/12. Refer to pages 86-87.

Corrosion Finish

Blue Stainless Steel Gold Coat
Grey HDG Green Triple Zinc

SKH / SKHH Skewed 45° Hangers

SKH – Standard 45° skew hanger allows for a 40° to 50° skew range, without hanger modification.

SKHH – For heavier applications.

Materials: 14 or 16 gauge

Finish: G90 galvanizing

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- The hangers listed are for standard sizes and will accommodate a 40° to 50° skew range.
- Most sizes do not require a bevel cut for installation. Refer to chart footnote identified with an asterisk.
- Illustrations show left and right skews. (SKH_L = skewed left; SKH_R = skewed right)
- For I-Joist installations, web stiffeners are required.
- Refer to illustration for staggered I-Joist application for double 2", 2-5/16", and 2-1/2" models.
- For double I-Joist installations, web stiffeners between I-Joists are required.

Typical SKH2520R-2
staggered I-Joist installation
right skew

SKHH210L

SKH2520R-2

SKHH210L-2

SKHH46LIF

Materials: 20 gauge

Finish: G90 galvanizing

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Diamond holes allow optional header nailing.
- Joist nails must be driven at a 30° to 45° angle through the purlin into the header to achieve listed loads. **Standard length "double shear" nails must be used to achieve listed load values.**
- 16d sinkers (0.148" dia. x 3-1/4") may be used where 10d commons are specified with no load reduction.

**Typical JPF24
installation**

**Typical JPF24
back-to-back installation**

JPF24

Purlin Size	USP Stock No.	Ref. No.	Steel Gauge	Dimensions (in)			Fastener Schedule ³						Unit	DF		S-P-F		Corrosion Finish
							Header ²			Joist				Factored Resistance		Factored Resistance

TUS – For a single ply purlin.

DTUS – For a single ply purlin with a 2-ply saddle dimension.

Materials: 20 gauge

Finish: G90 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Attaches with standard 1-1/2" joist hanger nails that can be installed with a positive placement nail gun or be hand driven.
- Other 1-1/2" fasteners with a shear value equal or greater than a 10d nail may be used.

Bottom View

1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) **NAILS:** 8d x 1-1/2" nails are 0.131" dia. x 1-1/2" long, 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, LL915 screws are #9 (0.131" dia.) x 1-1/2" long.

New products or updated product information are designated in **blue font**.

The FHD26 hanger straddles the header and receives a joist from both sides.

Materials: 18 gauge

Finish: G90 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- In panelized construction, installers are allowed to nail through both the sheathing and the hanger top flange with (1) 10d nail. The nail should be centered in the top flange and be no closer than 1/4" from the back or front edge of the top flange.

**Typical FHD26
installation**

FHD26

Joist Size	USP Stock No.	Ref. No.	Steel Gauge	Dimensions (in)			Fastener Schedule ³					Unit	DF Factored Resistance ¹		S-P-F Factored Resistance ¹

												kN	7.01	1.49	5.49	1.16

1) Loads listed are per side.

2) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

3) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 16d nails are 0.162" dia. x 3-1/2" long.

10d x 1-1/2 nails may be substituted for 16d header nails with a maximum load of 960 lbs.

New products or updated product information are designated in [blue font](#).

WT Wall Ties

Materials: 22 gauge

Finish: G90 galvanizing; WT22B-HDG – Hot-dip galvanized

Options: See chart for Corrosion Finish options

Installation:

- Use nails appropriate for intended use. See Product Notes, page 15.
- The opposite end must be bonded in the mortar joint of brick facade.
- Check local codes for spacing requirements.
- Meets prescriptive requirements of CSA A370 for corrugated strip ties.

1" space between
brick and sheathing

HWUH Heavy-Duty Welded Universal Hangers

Versatile heavy-duty top flange hanger attaches to both wood and masonry. Unique design allows builders to use one style hanger on the job when the structure has a variety of support materials.

Materials: Top Flange – 1/4" steel; Stirrup – 7 gauge

Finish: USP primer

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- NA21 nails are included with hangers where specified.
- **NA21 nails are not recommended for use with LVL, PSL, or LSL headers.**
- Masonry design load values apply to both solid concrete tie beams and grout-filled CMU walls.
- Alternate installation – Use (2) 1/2" x 4" Powers Fasteners Wedge-Bolts® or equal for loads up to 3455 lbs. when attaching to CMU. Loads shall not exceed table loads.

1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) **NAILS:** 10d nails are 0.148" dia. x 3" long, NA21 nails are 0.192" dia. x 1-3/4" long and are included with 4x, 6x, and 8x HWUH hangers.

New products or updated product information are designated in **blue font**.

Specialty Options Chart

Refer to Specialty Options pages 220, 222-223 for additional details.

Option	Skewed ^{1,3}	Sloped Seat ²	Sloped / Skewed ^{1,2,3}	Top Flange Offset		Saddle
Range	1° to 45°	1° to 45°	See Sloped Seat and Skewed	-- --		-- --
Factored Resistance	100% of table load	100% of table load	100% of table load	Hanger Width 3-1/2" or less 3-9/16" to 5-1/2" 5-9/16" to 7-1/2"	% of table load: 60% 75% 85%	100% of table load per side
Ordering	Add SK, angle required, right (R) or left (L), and square cut (SQ) or bevel cut (BV) to product number. Ex. HWUH410_SK45R_SQ	Add SL, slope required, and up (U) or down (D), to product number. Ex. HWUH410_SL30D	See Sloped Seat and Skewed. Ex. HWUH410_SK45R_SQ_SL30D	Add OS, and right (R) or left (L), to product number. Ex. HWUH410_OL		Add SA, and saddle width required to product number. Ex. HWUH410_SA=5-1/2"

1) Skewed hangers with skews greater than 15° may have all joist nailing on outside flange.

2) Sloped or sloped / skewed hangers with slopes greater than 15° may have additional joist nails.

3) For skewed hangers, the required cut type (square or bevel) of joist member may vary based on skew angle and width of hanger. Some square cut hangers will require custom pricing due to welded back plate.

New products or updated product information are designated in **blue font**.

These hangers are designed to support standard lumber joists, I-Joists, or beams. Easy installation into concrete block walls makes the MPH an attractive alternative to fabricating seats in masonry (or attaching ledgers) to support joists or beams.

Materials: 12 gauge

Finish: USP primer

Options: All nominal lumber sizes are available for rough full size lumber. See Specialty Options Chart on page 123.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- 16d duplex nails are not supplied with MPH hangers.
- Place hanger into position on top of concrete block. Install (2) 16d duplex nails (0.162" dia. x 3-1/2" double head) through the top flange nail holes. Then continue laying the next course of block.
- A minimum of one course shall be laid over hanger top flange and one course below hanger top flange. Courses adjacent to the top flange shall be subsequently grouted.
- **These products do not provide uplift resistance.**

1) Masonry compressive strength shall be minimum 1500 psi.

2) "Specify" denotes the required supported beam height that must be specified at the time of ordering.

3) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d duplex nails are 0.162" dia. x 3-1/2" long, double headed nails and shall be installed in grouted cells in accordance to manufacturer's installation specifications.

Ordering	Add SK, angle required, right (R) or left (L), and square cut (SQ) or bevel cut (BV) to product number. Ex. MPH210_SK45R_SQ	Add SL, slope required, and up (U) or down (D), to product number. Ex. MPH210_SL30D	See Sloped Seat and Skewed. Ex. MPH210_SK45R_SQ_SL30D	Add OS, and right (R) or left (L), to product number. Ex. MPH210_OL	

1) Skewed hangers with skew angles greater than 15° may have all joist nailing on outside flange.

2) Sloped or sloped / skewed hangers with slopes greater than 15° may have additional joist nails.

3) For skewed hangers, the required cut type (square or bevel) of joist member may vary based on skew angle and width of hanger. Some square cut hangers will require custom pricing due to welded back plate.

New products or updated product information are designated in **blue font**.

A versatile solution for hanging beams from masonry walls. Face mount design allows hanger to be used with beam heights from 16" to 24". Available in a variety of widths for solid sawn, glulam, or engineered lumber beams.

Materials: 1/4" steel

Finish: USP primer

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Fully grouted and reinforced concrete block or cast-in-place concrete with a minimum of (1) #5 rebar continuous to footing with standard hook at bolt locations.
- Minimum joist bearing length is 3-1/2".

Typical UMH installation

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) Fasten UMH hanger to concrete structure with two 3/4" dia. Powers Fasteners Wedge-Bolts® or equal with 5" minimum embedment.

Bolts shall be installed in masonry with grouted cells in accordance with manufacturer's installation specifications.

3) Bolts must conform to ASTM A 307 or better.

4) **NAILS:** 16d nails are 0.162" dia. x 3-1/2" long.

New products or updated product information are designated in **blue font**.

1) KEG, KEGQ, KLEG, KMEG hangers assume factored resistances with top flange.

2) KGLT, KHGLT hangers assume factored resistances based on 460 psi.

• Represents common applications and product configurations. Consult USP for additional applications and/or optional product configurations.

New products or updated product information are designated in **blue font**.

Sloped I-Joists

Use sloped seat hangers and beveled web stiffeners whenever the slope exceeds the following: 1/2:12 for seat bearing lengths of 2-1/2" or less; 3/8:12 for bearing lengths between 2-1/2" and 3-1/2"; and 1/4:12 for bearing lengths in excess of 3-1/2".

Multiple I-Joist Plies

Fasten together multiple plies of wood joists, in accordance with the manufacturer's installation guidelines, such that the joists act as a single unit.

I-Joist Rotation

It may be necessary to install straps, blocking, or sheathing to restrain torsional rotation of a supporting wood I-Joist when using top mount I-Joist hangers.

Fasteners

Install only the specified nails. The flanges of wood I-Joists may split if larger diameter nails or longer nails are installed. Do not install nails larger than 16d common wire nails (0.162" diameter) into the web stiffeners in the wood I-Joist.

Backer Blocks

Pattern the nails used to install backer blocks or web stiffeners in wood I-Joists to avoid splitting the block. The nail pattern should be sufficiently spaced to avoid the same grain line, particularly with solid sawn backer blocks. Backer blocks must be installed on wood I-Joist acting as the header, or supporting member. Install in accordance with the I-Joist manufacturer's installation guidelines. The nails used to install hangers mounted to an I-Joist header must penetrate through the web and into the backer block on the opposite side.

Top Flange Hangers

The thickness of the hanger metal and nail heads on top mount hangers must be evaluated for the effect on subsequent sheathing. Ensure that the top mount hanger is installed so the flanges of the hanger are not over-spread which tends to elevate the supported I-Joist causing uneven

floor surfaces and squeaking. Similarly, ensure that the hanger is installed plumb such that the face flanges of the hanger are mounted firmly against the wide-face surface of the header.

**Flush framing**
 **Hanger over-spread**

 **Hanger not plumb**

Correct Slant Nail Installation

Always secure wood I-Joist using 10d x 1-1/2" nail driven at a 30° to 45° angle and firmly seated

**Common Nailing Errors****Wrong Angle**

When a nail is driven into the bottom flange of the wood I-Joist parallel to the glue lines, separation of veneers can occur which substantially reduces the design loads of the connection.

**Nail Too Long**

When using nails longer than USP's recommended nails, bottom flange splitting may occur. Also, this can raise the wood I-Joist off the seat, resulting in uneven surfaces and squeaky floors along with reduced factored resistance.

Hangers for joists **without web stiffeners** must support the I-Joist's top flange and provide lateral resistance with no less than 1/8" contact.

Hangers for joists **with web stiffeners** must support a minimum of 60% of joist depth or potential joist rotation must be addressed.

(Top flange support requirements can be verified in this sections charts under Web Stiffener Req'd. Column.)

Nailer Installations

Correct Hanger Attachment to Nailer

A nailer or sill plate is considered to be any wood member attached to a steel beam, concrete block wall, concrete stem wall, or other structure unsuitable for nailing, which is used as a nailing surface for top mount hangers to hold beams or joists.

Nailer Sized Correctly

Top flange of hanger is fully supported and recommended nails have full penetration into nailer, resulting in a carried member hanging safely at the proper height.

The nailer must be sized to fit the support width as shown and be of sufficient thickness to satisfy recommended top flange nailing requirements. A design professional must specify nailer attachment to steel beams.

Avoid direct contact between hangers and steel beams which may cause squeaks

Correct Attachment

Wrong Nailer Size Causes Component Failure

Too Narrow

Top flange not fully supported can cause nail breakout. Or, by fully supporting top flange, hanger is tilted back, causing lifting of carried member which results in uneven surfaces and squeaky floors.

Too Wide

Loading can cause cross grain breaking of nailer. The recommended nailer overhang is 1/4" maximum per side.

Too Thin

Top flange nailing cannot fully penetrate nailer, causing reduced factored resistance. Never use hangers which require multiple face nails since the factored resistance are dependent on all nail holes being used.

The THFI is a face mount hanger designed to attach EWP I-joist members to wood headers. The unique design of the THFI combines the installation ease of a top mount hanger with the installation flexibility of a face mount hanger. Because the side flanges extend to the top chord of the I-joist, web stiffeners are not required. The THFI hangers also feature strategically placed Seat Cleats® which lock the bottom flange of the I-joist to the hanger eliminating the need for joist nails to be installed.

The innovative top flange alignment tabs with the holding cleats assist the placing and alignment of the hanger prior to nailing by hanging onto the header with holding cleats biting into the wood. If the alignment tabs are not desired or a deeper height member is to be carried, the tabs can be easily bent out of the way. Alignment tabs do not contribute to the allowable design values of the THFI hangers.

Materials: 18 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners.
- Alignment tabs are not structural and can be bent back or removed to assist hanger placement.
- Web stiffeners are not required for THFI hangers unless specified by the I-joist manufacturer. Web stiffeners are not required for lateral stability.
- For additional uplift capacity, install (2) 10d x 1-1/2" nails through diamond holes and into the joist member. (web stiffeners required)
- THFI2514 model has diamond holes in the header flange for MIN/MAX nailing option. For the MAX nailing option, install nails in both the round and diamond shaped header holes.

THFI2514

Typical THFI installation

Designed to provide lateral support for the top chords of I-Joists in depths up to 16". Eliminates the need for web stiffeners in most applications (see Web Stiffener Req'd. column in EWP Face Mount Hanger Chart for specific applications).

Materials: See EWP Face Mount Hangers charts, pages 132-134.

Finish: G90 galvanizing

Options: See Specialty Options chart.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Install 10d x 1-1/2" nails into joist through raised dimple at 30° to 45° angle.
- **THF Min** – Fill all round nail holes.
- **THF Max** – Fill all round and diamond holes.

Typical THF I-Joist to joist installation

Typical THF double I-Joist to LVL installation

THF single

THF double

Raised dimple nail holes allow 30° to 45° nailing into I-Joist bottom flange.

Seat Cleat® helps lock I-Joist into place for positive seating and nailing ease.

THF Specialty Options Chart

– refer to Specialty Options pages 220-221 for additional details.

Option	Skewed ^{1,3}	Sloped Seat ²	Sloped / Skewed ^{1,2,3}	Inverted Flange
Range	1° to 67-1/2° when width is 1-3/4" or less. 1° to 50° on all others.	1° to 45°	See Sloped Seat and Skewed	Not available in widths less than 2-1/4"
Factored Resistance	100% of table load. 75% of uplift load on skews greater than 15°.	100% of table load	80% of table load. 75% of uplift load on skews greater than 15°.	100% of table load. 65% of table load when nailing into the support members end grain.
Ordering	Add <i>SK</i> , angle required, right (<i>R</i>) or left (<i>L</i>), and square cut (<i>SQ</i>) or bevel cut (<i>BV</i>) to product number. Example: THF23925_SK45R_BV	Add <i>SL</i> , slope required, and up (<i>U</i>) or down (<i>D</i>), to product number. Example: THF23925_SL30D	See Sloped Seat and Skewed Example: THF23925_SK45R_BV_SL30D	Add <i>IF</i> , to product number. Example: THF23925_IF

1) Skewed hangers with skews greater than 15° may have all joist nailing on outside flange.

2) Sloped or sloped / skewed hangers with slopes greater than 15° may have additional joist nails.

3) For skewed hangers, the required cut type (square or bevel) of joist member may vary based on skew angle and width of hanger. Some square cut hangers will require custom pricing due to welded back plate.

4) Modifications to THF hangers do not feature seat cleats.

New products or updated product information are designated in blue font.

HD – Designed to support LVL, LSL, and PSL beams and headers in medium load conditions.

HDQIF – inverted flange face mount hangers fasten to LVL, LSL and PSL beams and headers with WS Wood Screws.

Materials: See EWP Face Mount Hangers charts, pages 134-136.

Finish: G90 galvanizing

Options: See Specialty Options chart.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- **HD** – Drive bend line nails into header at 45° to achieve listed loads.
- WS15 and WS3 Wood Screws are supplied with HDQIF hangers.

Typical HD installation

Typical HDQIF installation

Drive bend line nails into header at 45° to achieve listed loads.

Typical HD bend line nail installation

Factored Resistance	100% of table load. 75% of uplift load on skews greater than 15°.	100% of table load	80% of table load. 75% of uplift load on skews greater than 15°.	100% of table load. 65% of table load when nailing into the support members end grain.
Ordering	Add <i>SK</i> , angle required, right (<i>R</i>) or left (<i>L</i>), and square cut (SQ) or bevel cut (BV) to product number. Example: HD410_SK45R_SQ	Add <i>SL</i> , slope required, and up (<i>U</i>) or down (<i>D</i>), to product number. Example: HD410_SL30D	See Sloped Seat and Skewed Example: HD410_SK45R_SQ_SL30D	Add <i>IF</i> , to product number. Example: HD410_IF

1) Skewed hangers with skews greater than 15° may have all joist nailing on outside flange.

2) Sloped or sloped / skewed hangers with slopes greater than 15° may have additional joist nails.

3) For skewed hangers, the required cut type (square or bevel) of joist member may vary based on skew angle and width of hanger. Some square cut hangers will require custom pricing due to welded back plate.

4) HD option hangers may be manufactured as welded products to achieve listed loads. Welded products have a primer finish.

New products or updated product information are designated in **blue font**.

HUS Face Mount Hangers

Designed for medium load conditions. Extended 3" deep seat provides extra truss bearing.

Materials: 16 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Joist nails must be driven at a 30° to 45° angle through the joist into the header to achieve listed loads. Standard length "double shear" nails must be used to achieve listed load values.

Typical HUS double shear installation

Typical HUS installation

HUS

THD – Medium capacity hanger for LVL, LSL, and PSL beams.

THDH – Heavy capacity hanger for LVL, LSL, and PSL beams.

Materials: See EWP Face Mount Hangers charts, pages 135-136.

Finish: G90 galvanizing

Options: Rough/ Full sizes available for THD series.
See Specialty Options chart.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- **THD** – Drive bend line nails into header at 45° to achieve listed loads.
- **THDH** – Drive joist nails into header at 30° to 45° to achieve listed loads.

Typical THDH installation

Typical THD installation

THDH26-2

THD single

Some model designs may vary from illustration shown

Drive joist nails into header at 30° to 45° to achieve listed loads.

Typical THDH double shear installation

Drive bend line nails into header at 45° to achieve listed loads.

Typical THD bend line nail installation

THD double or larger

Specialty Options Chart

– refer to Specialty Options pages 220 and 222 for additional details.

Option	USP Series	Skewed ^{1,3,4}	Sloped Seat ²	Sloped / Skewed ^{1,2,3,4}	Inverted Flange
Range	THD	1° to 45°	1° to 45°	See Sloped Seat and Skewed	Not available in widths less than 3". Widths greater can have one flange inverted.
	THDH				N/A
Factored Resistance	THD	85% of table load	65% of table load	65% of table load	100% of table load. 65% of table load when nailing into the support members end grain.
	THDH	85% of table load. 50% of table uplift load.	52% of table load	52% of table load. 50% of table uplift load.	N/A
Ordering	THD	Add SK, angle required, right (R) or left (L), and square cut (SQ) or bevel cut (BV) to product number. Ex. THDH410_SK45R_BV	Add SL, slope required, and up (U) or down (D), to product number. Ex: THDH410_SL30D	See Sloped Seat and Skewed Ex. THDH410_SK45R_BV_SL30D	Add 1IF, one flange, right (R) and left (L), Ex. THD410_1IFR
	THDH				N/A

1) Skewed hangers with skews greater than 15° may have all joist nailing on outside flange. All skewed THDH hangers have nails on one side only.

2) Sloped or sloped / skewed hangers with slopes greater than 15° may have additional joist nails.

3) THDH models - Skewed hangers typically require a bevel cut. A square cut option may be available as a custom.

4) THD models - For skewed hangers, the required cut type (square or bevel) of joist member may vary based on skew angle and width of hanger. Some square cut hangers will require custom pricing due to welded back plate.

1) Factored uplift resistance has been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.

Load tables address hanger/header/fastener limitations only. Joist limitations must be determined for each installation.

New products or updated product information are designated in **blue font**.

1) Factored uplift resistance has been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) WS15 Wood Screws are 1/4" x 1-1/2", WS3 Wood Screws are 1/4" x 3" and are included with HDQ hangers.

3) NAILS: 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.

Load tables address hanger/header/fastener limitations only. Joist limitations must be determined for each installation.

New products or updated product information are designated in blue font.

TFI / THO – Engineered for I-Joist to header applications. Offers full lateral support of the I-Joist top chord, eliminating the need for web stiffeners in most applications. Raised dimple nailing guides help assure correct 45° nailing into the I-Joist bottom flange. The THO's feature the Seat Cleat® that allows for quick, positive seating. The Seat Cleat® will hold the I-Joist in place, eliminating spring back during nailing in the bottom flange.

TFL – Features 1-1/2" top flange depth that accommodates all header types as well as back-to-back installations. Also features USP's Seat Cleat® for quick, positive seating.

Materials: See EWP Top Mount Hangers charts, pages 141-150.

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Refer to the top mount chart for applications requiring web stiffeners.
- Requirements for web stiffener from the I-Joist manufacturer should be followed, even if web stiffeners are not required in USP literature.

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) Listed loads shall not be increased.

3) The nailer must be sized to fit the supported width and be of sufficient thickness to satisfy specified top flange nailing requirements. A design professional must specify nailer attachment to steel beams.

4) **NAILS:** 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.

These hangers are used to support LVL, LSL, and PSL beams and headers in medium-to-heavy load conditions.

Materials: BPH – 12 gauge; HBPH – 10 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Refer to the top mount chart for applications requiring web stiffeners.
- Requirements for web stiffener from the I-Joist manufacturer should be followed, even if web stiffeners are not required in USP literature.
- For welded installations, see page 224.

Specialty Options Chart – refer to Specialty Options pages 220 and 222 for additional details

Option	Skewed ^{1,3}	Sloped Seat ²	Sloped / Skewed ^{1,2,3}	Sloped Top Flange ⁴
Range	1° to 50°	1° to 45°	See Sloped Seat and Skewed	0° to 45°
Factored Resistance	100% of table load	100% of table load	100% of table load	Reduce allowable table loads using straight-line interpolation
Ordering	Add <i>SK</i> , angle required, right (<i>R</i>) or left (<i>L</i>), and square cut (<i>SQ</i>) or bevel cut (<i>BL</i>) to product number. Example: BPH3595_SK45R_SQ	Add <i>SL</i> , slope required, and up (<i>U</i>) or down (<i>D</i>), to product number. Example: BPH3595_SL30D	See Sloped Seat and Skewed. Example: BPH3595_SK45R_SQ_SL30D	Add <i>SF</i> , angle required and right (<i>R</i>) or left (<i>L</i>), to product number. Example: BPH3595_SF30L

1) Skewed hangers with skews greater than 15° may have all joist nailing on outside flange.

2) Sloped or sloped / skewed hangers with slopes greater than 15° may have additional joist nails.

3) **For skewed hangers, the required cut type (square or bevel) of joist member may vary based on skew angle and width of hanger. Some square cut hangers will require custom pricing due to welded back plate.**

4) Sloped top flanges with slopes greater than 15° may have additional header nails.

New products or updated product information are designated in **blue font**.

Heavy-duty hanger for LVL, LSL, and PSL beams.

Materials: 7 gauge

Finish: USP primer

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- For welded installations, see page 224.
- NA16D-RS ring shank nails are supplied with HLBH hangers.

1) Factored uplift resistance has been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) When I-joist is used as a header, all nails must be 10d x 1-1/2.

3) **NAILS:** 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.

Load tables address hanger/header/fastener limitations only. Joist limitations must be determined for each installation.

New products or updated product information are designated in **blue font**.

1) Factored uplift resistance has been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) When I-joist is used as a header, all nails must be 10d x 1-1/2.

3) **NAILS:** 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.

Load tables address hanger/header/fastener limitations only. Joist limitations must be determined for each installation.

New products or updated product information are designated in **blue font**.

1) Factored uplift resistance has been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) When I-joist is used as a header, all nails must be 10d x 1-1/2.

3) **NAILS:** 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.

Load tables address hanger/header/fastener limitations only. Joist limitations must be determined for each installation.

New products or updated product information are designated in **blue font**.

1) Factored uplift resistance has been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) When I-joist is used as a header, all nails must be 10d x 1-1/2".

3) **NAILS:** 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.

Load tables address hanger/header/fastener limitations only. Joist limitations must be determined for each installation.

New products or updated product information are designated in **blue font**.

The TMP and TMPH are designed to make rafter-to-plate connections and eliminate time-consuming bird's-mouth notching or bevel plate installation. Both series are available in I-Joists sizes, as well as standard 2x sizes.

TMP – Adjusts to pitches from 1/12 to 6/12.

TMPH – Adjusts to pitches from 6/12 to 14/12.

Materials: TMP – 18 gauge;

TMPH – 16 gauge, Fulcrum – 12 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Position connector on top plate. Fasten connector to outside of top plate with specified nails. Insert rafter into rafter pocket. Adjust rafter and pocket to correct pitch. Fasten rafter to connector with specified nails. Installing the TMP requires driving specified nails through the opposing slots in the pocket. TMPH installation involves sliding the fulcrum until it supports the pocket at the desired pitch and nailing down through the fulcrum base into the top plate to lock the fulcrum into position.

TMP

TMPH

Pitch Range:
TMP - 1/12 – 6/12
TMPH - 6/12 – 14/12

Typical TMP installation

Typical TMPH installation

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase is allowed.

2) Web stiffeners are required for all Wood I-Joist installations.

3) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long.

New products or updated product information are designated in **blue font**.

The LSSH series connects rafters to ridge beams in vaulted roof structures. This series is field adjustable to meet a variety of skew and/or slope applications. Slopes and skew 0° to 45°.

Materials: See chart

Finish: G90 galvanizing; LSSH15-TZ – G-185 Galvanizing

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.

Steps:

1. Position LSSH connector against plumb-cut end of joist. Fasten joist side flanges on both sides with 10d (0.148") x 1-1/2" nails. Bend seat up to fit against joist bottom and drive (1) 10d (0.148") x 1-1/2" nail through bottom seat into rafter bottom. Drive (2) 10d (0.148") x 1-1/2" nails at downward angle through dimpled nailing guides.
 2. Lean connector and rafter end against ridge beam at desired position. Install specified 10d (0.148" x 3") or 16d (0.162" x 3-1/2") nails through nail holes into ridge beam at right 90° angle. If skewing the rafter, only drive nails into ridge beam on inside flange.
 3. Bend flange to desired angle.
 4. Hammer outside flange until edge touches header. Fasten outside flange to ridge by driving specified 10d (0.148" x 3) or 16d (0.162" x 3-1/2") nails through nail holes.
- Web stiffeners are required for all wood I-Joist installations.
 - Designer may consider adding a tension restraint for the supported member for roof slopes exceeding 6/12. Refer to pages 86-87.

Typical LSSH179 installation

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d nails are 0.162" dia. x 3-1/2" long.

New products or updated product information are designated in **blue font**.

Corrosion Finish

 Stainless Steel
  Gold Coat
 HDG
  Triple Zinc

LGU, MGU, and HGU's are high capacity girder to girder face mount connectors. Fastening is by WS structural screws for ease of installation. Fastenings are placed high on connector to permit the connection of a deep carried member to a shallower carrying member. Very useful where tops of beams must be flush.

Materials: LGU / MGU – 10 gauge; HGU – 7 gauge

Finish: G90 galvanizing

Options: See Specialty Options chart on page 158.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- WS structural screws supplied with connector. Substituting lag screws will reduce capacity.
- Beams comprised of multiple plies must be laminated to act as a single member.
- Multi-ply carrying beams may require additional connection of laminations at connector.
- Beam height dimension (H) must be specified when ordering.

Typical LGU, MGU, HGU installation

LGU, MGU, HGU

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) H denotes minimum hanger height. Specify height when ordering.

3) WS3 Wood Screws are 1/4" x 3" long and are included in hangers.

New products or updated product information are designated in **blue font**.

Specialty Options Chart

– refer to Specialty Options pages 220 and 222 for additional details

Option	USP Series	Skewed ¹	Inverted Flange
Range	LGU MGU HGU	1° to 45°	One Inverted-Flange option available on some sizes. See footnotes 2 and 3.
Factored Resistance	LGU	55% of table value. 30% of uplift.	100% of table value
	MGU	65% of table value. 30% of uplift.	
	HGU	70% of table value. 30% of uplift.	
Ordering	LGU MGU HGU	Add <i>SK</i> , angle required, right (<i>R</i>) or left (<i>L</i>), and square cut (<i>SQ</i>) or bevel cut (<i>BV</i>) to product number. Ex. LGU525_H=18_SK45R_SQ	Add <i>1IF</i> and right (<i>R</i>) or left (<i>L</i>) to product number. Ex. LGU525_H=18_1IFR

1) Skewed hangers with skews greater than 15° may have all joist fasteners on outside flange.

2) One inverted-flange (1IF) is available on the following sizes:
LGU363, LGU525
MGU525, MGU550, MGU563, MGU700
HGU525, HGU550, HGU562, HGU700, HGU725, HGU900

3) The inverted flange option is not available on skewed LGU, MGU or HGU hangers.

4) Bevel cut required on skewed parts to meet table loads.**5) Skewed hangers typically require a bevel cut however, a square cut option may be available as a custom when requested.**New products or updated product information are designated in **blue font**.**GHF** Glulam Face Mount Hangers**Materials:** See chart**Finish:** USP primer**Options:** See Specialty Options Chart on page 159.**Installation:**

- Use all specified fasteners. See Product Notes, page 15.
- WS Wood Screws are supplied with GHF hangers.

Typical GHF51135 installation

1) Factored resistances based on seat bearing calculated at 560 psi perpendicular to grain.

2) WS25 Wood Screws are 1/4" x 2-1/2" long and the WS3 Wood Screws are 1/4" x 3" long and are included with GHF hangers.

3) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

New products or updated product information are designated in **blue font**.**Specialty Options Chart**

– refer to Specialty Options pages 220-221 for additional details

Option	Skewed ^{1,3}	Sloped Seat ²	Sloped / Skewed ^{1,2}	Inverted Flange
Range	1° to 50°	1° to 45°	See Sloped Seat and Skewed	Not available in widths less than 4-1/2"
Factored Resistance	100% of table load. 75% of uplift load on skews greater than 15°.	100% of table load	80% of table load on skews greater. 75% of uplift load than 15°.	100% of table load. 65% of table load when nailing into the support members end grain.
Ordering	Add <i>SK</i> , angle required, right (<i>R</i>) or left (<i>L</i>), and square cut (<i>SQ</i>) or bevel cut (<i>BV</i>) to product number. Ex. GHF31900_SK45R_BV	Add <i>SL</i> , slope required, and up (<i>U</i>) or down (<i>D</i>), to product number. Ex. GHF31900_SL30D	See Sloped Seat and Skewed. Ex. GHF31900_SK45R_BV_SL30D	Add <i>IF</i> to product number. Ex. GHF51135_IF

1) Skewed hangers with skews greater than 15° may have all joist nailing on outside flange.

2) Sloped or sloped / skewed hangers with slopes greater than 15° may have additional joist nails.

3) **Skewed hangers typically require a bevel cut however, a square cut option may be available as a custom when requested.**New products or updated product information are designated in **blue font**.**Typical GHF51135IF inverted flange installation**

Bolt-only fastening, heavy steel construction, and a continuous top flange allow the KLEG, KMEG, and KEG products to have high load capacities.

KLEG – (4) bolt light-duty hanger.

KMEG – (6) bolt medium-duty hanger.

KEG – (8) bolt heavy-duty hanger.

Materials: See chart

Finish: USP primer

Options: See Specialty Options Chart.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Bolts are not supplied unless ordered separately. Bolts provided by other suppliers must meet or exceed ASTM A 307 Grade A, or ASME SAE Grade 2, or better.
- **Minimum header height is 10" for the KLEG; 13" for the KMEG; 20" for the KEG.**
- Beam height dimension (H) must be specified when ordering.

1) Factored resistances are for a supporting member with a width of 5-1/2", and 560 psi perpendicular to grain loading in single shear.

2) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

3) "Specify" denotes the required supported beam height that must be specified at the time of ordering.

New products or updated product information are designated in **blue font**.

Specialty Options Chart

– refer to Specialty Options pages 220, 222-223 for additional details

Ordering	Add <i>SK</i> , angle required, right (<i>R</i>) or left (<i>L</i>), and square cut (<i>SQ</i>) to product number. Ex. KLEG3_H=112_SK45R_SQ	Add <i>SL</i> , slope required, and up (<i>U</i>) or down (<i>D</i>), to product number. Ex. KLEG3_H=112_SL30D	Add <i>OS</i> , and right (<i>R</i>) or left (<i>L</i>), to product number. Ex. KLEG3_H=112_OSL

1) Top flange offset hangers may not be skewed.

2) Top flange offset option is not available for KEG models.

3) Carried member must have square cut end on skewed option. Refer to Typical PHXU hanger, skewed, left shown, Type B illustration on page 222.

New products or updated product information are designated in **blue font**.

These hangers cover medium-to-heavy glulam beam and purlin applications.

KHGB – Medium capacity hanger.

KGB – Medium-to-heavy capacity hanger.

KHGB – Heavy capacity hanger.

Materials: 7 gauge

Finish: USP primer

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- WS3 Wood Screws are supplied with hangers.
- Beam height dimension (H) must be specified when ordering.
- **Minimum height (H) is 7-1/2".**
- See Welded Installation chart on page 224.

**Typical KHGB
installation**

1) Factored resistances are based on 560 psi perpendicular to grain loading.

2) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

3) "Specify" denotes the required supported beam height must be specified at the time of ordering.

4) Supporting header shall be no less than 3" thick.

5) WS3 Wood Screws are 1/4" x 3" long and are included with hangers.

New products or updated product information are designated in **blue font**.

These heavy beam hangers are designed for use with glulam and timber beams. The continuous top mount flange offers high load capacity with minimal nailing.

KGLT – Medium capacity hanger.

KHGLT – Heavy capacity hanger.

Materials: Top Flange – 3 gauge; U-Strap – 7 gauge

Finish: USP primer

Options: See Specialty Options Chart on page 163.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Beam height dimension (H) must be specified when ordering.
- See Welded Installation chart on page 224.

1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) KGLT and KHGLT load values based on 625 psi perpendicular to grain loading.

3) "Specify" denotes the required supported beam height that must be specified at time of ordering, with 7-1/2" being the minimum.

4) WS3 Wood Screws are 1/4" x 3" long and are included with the hangers.

5) No further increase for duration of load allowed.

New products or updated product information are designated in **blue font**.

Specialty Options Chart

– refer to Specialty Options pages 220, 220-223 for additional details

Option	Skewed ^{1,3}	Sloped Seat ^{2,3}	Sloped / Skewed ^{1,2,3}	Sloped Top Flange ⁴	Top Flange Offset	Saddle
Range	1° to 50°	1° to 45°	See Sloped Seat and Skewed	0° to 45°	-- --	-- --
Factored Resistance	50% of uplift load on skew greater than 15°	KGLT - 5920 lbs. Max. KHGLT - 10080 lbs. Max.	50% of uplift load on skew greater than 15°	Reduce table loads using straight-line interpolation	60% of table load for KGLT. 45% of table load for KHGLT.	100% of table load per side
Ordering	Add <i>SK</i> , angle required, right (<i>R</i>) or left (<i>L</i>), and square cut (<i>SQ</i>) or bevel cut (<i>BV</i>) to product number. Ex. KGLT3_H=16_SK45R_BV	Add <i>SL</i> , slope required, and up (<i>U</i>) or down (<i>D</i>), to product number. Ex. KGLT3_H=16_SL30D	See Sloped Seat and Skewed. Ex. KGLT3_H=16_SK45R_BV_SL30D	Add <i>SF</i> , angle required and right (<i>R</i>) or left (<i>L</i>), to product number. Ex. KGLT3_H=16_SF30L	Add <i>OS</i> , and right (<i>R</i>) or left (<i>L</i>), to product number. Ex. KGLT3_H=16_OSL	Add <i>SA</i> , and saddle width required to product number. Ex. KGLT3_H=16_SA=5-1/2"

1) Skewed hangers with skews greater than 15° may have all joist nailing on outside flange.

2) Sloped or sloped / skewed hangers with slopes greater than 15° may have additional joist nails.

3) Skewed hangers typically require a bevel cut however, a square cut option may be available as a custom when requested.

4) Sloped top flanges with slopes greater than 15° may have additional header nails.

New products or updated product information are designated in blue font.

KGLS / KGLST / KHGLS / KHGLST Glulam Saddle Hangers**KGLS** – Saddle hanger.**KGLST** – Saddle hanger with seismic straps.**KHGLS** – Heavier version of KGLS.**KHGLST** – Heavier version of KGLST.**Materials:** Top flange - 3 gauge; Stirrup - 7 gauge**Finish:** USP primer**Options:** See KGLS & KHGLS Specialty Options Chart on page 164.**Codes:** Load values are derived from data submitted to various North American building code evaluators.**Installation:**

- Use all specified fasteners. See Product Notes, page 15.
- Loads and nail schedule apply to each saddle hanger stirrup.
- **Minimum header height is 8-1/2" for the KGLS; 8-1/2" for the KGLST; 10-1/2" for the KHGLS, and 10-1/2" for the KHGLST.**
- Beam height dimension (H) must be specified when ordering.
- **KGLST and KHGLST** models include seismic straps which must be installed with (3) 3/4" thru-bolts in each supported member and (2) 3/4" thru-bolts into the supporting beams.
- See Welded Installation chart on page 224.

1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) Factored resistances and fastener schedules apply to each side of the saddled hanger.

3) Minimum header height is 8-1/2" for the KGLS and KGLST; 10-1/2" for the KHGLS and KHGLST.

4) Hangers with seismic straps may require a minimum joist depth. Consult USP for additional information.

5) WS3 Wood Screws are 1/4" x 3" long and are included with hangers.

6) The bearing loads are based on 560 psi.

7) "Specify" denotes the required supported beam height that must be specified at time of ordering.

New products or updated product information are designated in **blue font**.

KGLS / KHGLS Specialty Options Chart – refer to Specialty Options pages 220, 222-223 for additional details

Option	Skewed ^{1,3}	Sloped Seat ²	Sloped / Skewed ^{1,2}	Sloped Top Flange ⁴	Top Flange Offset	Saddle
Range	1° to 50°	1° to 45°	See Sloped Seat and Skewed	0° to 30°	May not be skewed	5" minimum saddle
Factored Resistance	KGLS - 6500 lbs. Max. KHGLS - 7980 lbs. Max. 50% of uplift load on skews greater than 15°.	KGLS - 9360 lbs. Max. KHGLS - 13200 lbs. Max.	KGLS - 7920 lbs. Max. KHGLS - may not be sloped / skewed.	Reduce allowable table loads using straight-line interpolation.	50% of table load for KGLS. 45% of table load for KHGLS.	100% of table load per side
Ordering	Add SK, angle required, right (R) or left (L), and square cut (SQ) or bevel cut (BV) to product number. Ex. KGLS35H115_SK45R_BV	Add SL, slope required, and up (U) or down (D), to product number. Example: KGLS35H115_SL30D	See Sloped Seat and Skewed. Example: KGLS35H115_SK45R_BV_SL30D	Add SF, angle required, and right (R) or left (L), to product number. Example: KGLS35H115_SF30L	Add OS, and right (R) or left (L), to product number. Example: KGLS35H115_OSL	Add SA, and saddle width required to product number. Example: KGLS35H115_SA=5-1/2"

1) Skewed hangers with skews greater than 15° may have all joist nailing on outside flange.

2) Sloped or sloped / skewed hangers with slopes greater than 15° may have additional joist nails.

3) **Skewed hangers typically require a bevel cut however, a square cut option may be available as a custom when requested.**

4) Sloped top flanges with greater than 15° may have additional header nails.

New products or updated product information are designated in **blue font**.

Moisture Barrier Plates protect the bottom chords of trusses from moisture damage caused by direct contact with concrete. These plates eliminate the need for more expensive treated wood plates.

Materials: See chart

Finish: G90 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Pre-attach to truss bottom chord or rafter using pre-punched prongs and/or 6d common nails to prevent wood-to-concrete contact.

Size	USP Stock No.	Ref. No.	Steel Gauge	Dimensions (in)		Fastener Schedule ¹	
				W	L	Qty	Type
2x	NOP2X	TSS2, TBP8	26	1-7/16	8	-- --	-- --
	NOP1	-- --	22	1-1/2	8	2	6d
4x	NOP4	TSS2-2	26	3-1/2	8	2	6d

1) **NAILS:** 6d nails are 0.120" dia. x 2" long.

Typical NOP4 installation

NOP1

NOP2X

NOP4

LPTA Embedded Truss Anchors

Low profile design attaches to 2 x 4 or larger bottom chords and provides uplift and lateral load resistance.

Materials: 18 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Embed LPTA 4" into concrete tie beam or masonry bond beam.
- Anchors should be spaced no closer than 8" center-to-center.
- **Moisture barrier may be required.**

Typical LPTA perpendicular installation

LPTA

Typical LPTA parallel installation

USP Stock No.	Ref. No.	Steel Gauge	Dimensions (in)		Fastener Schedule		Unit	DF Factored Resistance ¹			S-P-F Factored Resistance ¹		
			W	H	Min Qty ²	Type ³		Uplift	F1	F2	Uplift	F1	F2

LPTA	LTA2	18	5	8-1/4	10	10d x 1-1/2	Lbs	1555	1005	1865	1555	1005	1865
							kN	6.92	4.47	8.30	6.92	4.47	8.30

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) Minimum quantity of fasteners to be installed. Product may have additional nail holes not needed to meet published factored resistance of product.

3) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long.

The HLPTA75 is designed and tested to provide higher lateral capacity and net uplift. Offers greater pullout resistance and is compatible with bond beam reinforcing.

Materials: 18 gauge

Finish: G90 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
 - Embed in concrete tie beam or masonry bond beam until the seat is resting on the surface.
 - Minimum of one #7 rebar or two #5 rebars through the theoretical shear cone is required.
 - Grout or concrete compressive strength shall be 2,500 psi at 28 days.
 - Minimum spacing between anchors is 10" to achieve full design load capacities on single anchors.
 - When used in a double rebar installation, concrete tie beam stirrup should be sized to accommodate connector leg placement.
 - Designer shall verify connector clearance when using in conjunction with stirrups and two rebar applications.
 - Verify grout is not in contact with truss member.
- Moisture barrier may be required.**

1) Short-term load duration has been taken into consideration; no further increase is allowed.

2) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long.

New products or updated product information are designated in **blue font**.

The RFUS is a multi-purpose engineered solution for attaching trusses to concrete or masonry walls. Wedgebolt™ fastening eliminates mislocated cast-in-place anchor bolts and allows retrofit installations. Works with heel heights up to 14".

Materials: 10 gauge

Finish: USP primer

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- **Always install in pairs.**
- Use all specified fasteners. See Product Notes, page 15.
- Designer shall be responsible for design of masonry structure, including any required reinforcement.
- For 1 ply applications, add filler block. Refer to page 190 for wood filler block installation.
- **Moisture barrier may be required.**

Typical RFUS installation

RFUS

USP Stock No.	Ref. No.	Steel Gauge	No. of Plies ⁵	Fastener Schedule ^{3,4}				DF		S-P-F

RFUS	FGTR	10	2 Ply >	12	WS3	4	3/4" x 6" Wedge Bolts	5690	25.31	4780	21.26

- 1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.
- 2) Use Powers Fasteners 3/4" x 6" Wedge Bolts; or equal, installed in accordance with manufacturer's specifications.
- 3) Fasteners shall be installed to fully grouted and reinforced concrete masonry or reinforced concrete (f'c = 2,500 psi at 28 days).
- 4) Fastener shedule is for two straps used together. The straps shall be installed in pairs.
- 5) Truss plies shall be fastened together to act as a unit.
- 6) WS3 Wood Screws are 1/4" x 3" long and are supplied with RFUS connector.

The LUGT series is an extremely adaptable tiedown for girder trusses and offers several installation options to accommodate different framing conditions. It is an ideal retrofit solution to reinforce truss connections to transfer high wind loads to supporting walls and can be used on either, concrete or CMU block walls. Sizes available for 2-ply, 3-ply and 4-ply trusses.

Materials: See chart

Finish: G90 galvanizing

Codes: Factored resistances are derived from data submitted to various North American building code evaluators and are in accordance with CSA 086-14.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- All fastener holes must be filled with specified fasteners to achieve loads listed in the chart. Smaller fasteners holes are for girder-to-stud applications (reference page 172) and do not need to be filled when used for concrete/masonry installations.
- WS Wood Screws included with LUGT3 and LUGT4.
- Powers Wedge-Bolt+ Fasteners require the Powers SDS Wedge-Bit drill bit. USP #1314. Refer to page 28. Wedge-Bits are not included and must be ordered separately.
- **For concrete and masonry applications, a moisture barrier may be required, check local building code.**

								kN	23.40	--	--	19.02	--	--

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) Factored resistances apply where roof pitch is between 3:12 and 8:12.

3) Additional anchorage products to be designed by others.

4) 1/4WB denotes a 1/4" x 3" Powers "Wedge Bolt" or equivalent installed in a predrilled hole. Refer to manufacturer's literature for further information.

5) 3/8WB denotes a 3/8" x 5" Powers "Wedge Bolt" or equivalent installed in a predrilled hole. Refer to manufacturer's literature for further information.

6) Fasteners must be installed in fully grouted and reinforced concrete masonry ($f'm = 1500$ psi) or reinforced concrete ($f'c = 2,500$ psi).

7) Wedge Bolts are not supplied with the LUGT2, LUGT3 or LUGT4.

8) **NAILS:** 10d nails are 0.148" dia. x 3" long, WS25 Wood Screws are 1/4" dia. x 2-1/2" long (supplied with LUGT3) and WS3 Wood Screws are 1/4" dia. x 3" long (supplied with LUGT4).

New products or updated product information are designated in **blue font**.

MUGT Girder Tiedown

Designed for higher uplift resistance for concrete block construction.
 The MUGT15 can accommodate variable truss bearing depths.

Materials: 12 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- When straps are wrapped over the truss, install nails in backside of truss. See MUGT15 installation diagram for minimum nail requirements into the face and on top of the truss.
- If installed straight-up with no wrap over the top of the truss, fill all nail holes.
- **Moisture barrier may be required.**

Typical MUGT15 installation

MUGT15

USP Stock No.	Ref. No.	Steel Gauge	Mounting Condition	Fastener Schedule ²						DF Factored Resistance		S-P-F Factored Resistance	
				Anchor Bolt ³		Rafter/Truss ⁴				Uplift 115% ¹		Uplift 115% ¹

			Top-Min	1	5/8	4	6	12	10d	4320	19.22	3715	16.53

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) Additional anchorage products to be designed by others.

3) Designer must specify anchor bolt type, length, and embedment.

4) **NAILS:** 10d nails are 0.148" dia. x 3" long.

HUGT Girder Tiedowns

The HUGT series high uplift girder tiedowns can be installed on beams and top chords of trusses with slopes from 0° to 34°.

Materials: 7 gauge

Finish: USP primer

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Install the HUGT over the beam or truss (see "W" dimension on chart for appropriate width).
- Attached members shall be designed to resist applied loads.
- **Moisture barrier may be required.**

Typical HUGT2 installation

HUGT

USP Stock No.	Ref. No.	Steel Gauge	W (in)	O.C. Dim Between Anchors (in)	Fastener Schedule ^{3,4}				DF Factored Resistance		S-P-F Factored Resistance

HUGT4	HGT-4	7	6-7/8	9	2	3/4	8	10d	18575	82.63	9365	41.66

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) Factored resistances apply where roof pitch is between 3:12 and 8:12.

3) Additional anchorage products to be designed by others.

4) Designer must specify anchor bolt type, length, and embedment.

5) **NAILS:** 10d nails are 0.148" dia. x 3" long.

For installation into grouted concrete tie beam or masonry bond beam.
Provides lateral and uplift resistance.

Materials: 14 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Install USP's WS15 Wood Screws into the truss and drill holes for wedge bolts. Install wedge bolts into concrete block per manufacturer's recommendation.
- WS Wood Screws and Wedge bolts are included with HGAM10 angles.
- Powers Wedge-Bolt+ Fasteners require Powers SDS Wedge-Bit drill bit, USP #1314. Refer to page 28. Wedge-Bits are not included and must be ordered separately.
- Moisture barrier may be required.

Typical HGAM10 installation

HGAM10

USP Stock No.	Ref. No.	Steel Gauge	Fastener Schedule ²				Unit	DF				S-P-F			
			Rafter/Truss		Plate ³			Factored Resistance				Factored Resistance

							kN	4.20	4.96	5.12	3.40	3.63	4.25	4.40	2.94

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase is allowed.

2) WS15 Wood Screws are 1/4" x 1-1/2" long.

3) Use Powers Fasteners 1/4" x 1-3/4" Wedge-Bolt® (included); or equal. Drill hole in concrete or masonry with 1/4" masonry drill bit. Refer to manufacturer's literature for further information.

SHA Masonry Uplift Connectors

Connects trusses directly to masonry or concrete and features slotted base holes to ease installation.

Materials: Angle – 3 gauge; Gussets – 10 gauge

Finish: USP primer

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Bolts must be ordered separately.
- Install directly flush to masonry wall.
- The SHA series connectors shall be installed in pairs.
- Moisture barrier may be required.

USP Stock No.	Ref. No.	Fastener Schedule ³				No. of Plies ⁶	Unit	DF Factored Resistance	S-P-F Factored Resistance

							kN	49.73	39.26
						3 Ply or >	Lbs	12600	8945
							kN	56.05	39.79

1) Factored resistances have been increased 15% for wind or seismic loads; no further increase shall be permitted.

2) Factored resistances are for a pair of SHA devices. SHA's shall be installed in pairs.

3) Fastener schedule is for a pair of SHA devices.

4) 1/2" x 8" J-Bolts or equivalent.

5) Concrete compressive strength shall be 2500 psi or greater at 28 days.

6) Multiple ply truss shall be fastened together to act as a single unit.

7) Bolts shall conform to ASTM A 307 or better.

8) The designer must specify anchor bolt type, length, and embedment.

Typical SHA6 installation

SHA6

Typical SHA6T installation

SHA6T

RTM Hurricane Retrofit Connector

Designed as a retrofit connector for trusses installed on top plates.
Can also be used as a holdown for a roof or floor system.

Materials: 18 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Tapcon® Concrete Screws are not supplied with RT16M connector.
- Install Tapcon® Concrete Screws in lower two holes for Single Top Plate or Conventional Raised Foundation or Modular Home Installations.
- **Moisture barrier may be required.**

Typical RT16M
top plate installation

RT16M

USP Stock No.	Ref. No.	Steel Gauge	Fastener Schedule ^{2,3,4}							DF Factored Resistance ¹				S-P-F Factored Resistance ¹

									kN	7.52	--	--	--	6.54	--	--	--

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase is allowed.

2) Install with 1/4" x 1-3/4" Tapcon® Concrete Screws in accordance to manufacturer's installation specifications.

3) Fasteners to be installed to fully grouted and reinforced concrete masonry.

4) **Nails:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long.

HGA Hurricane Gusset Angles

Versatile wood-to-wood connector that satisfies high wind and seismic loading requirements.

Materials: 14 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Install with USP's WS3 Wood Screws into top plate, and WS15 Wood Screws into the truss.
- WS Wood Screws are included with HGA10 angles.
- **Moisture barrier may be required.**

Typical HGA10 installation

HGA10

USP Stock No.	Ref. No.	Steel Gauge	Fastener Schedule ²				Unit	DF Factored Resistance ¹				S-P-F Factored Resistance ¹

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase is allowed.

2) WS15 Wood Screws are 1/4" x 1-1/2" long and WS3 Wood Screws are 1/4" x 3" long.

LUGT Girder Tiedowns

The LUGT series is an extremely adaptable tiedown for girder trusses and offers several installation options to accommodate different framing conditions. It is an ideal retrofit solution to reinforce truss connections to transfer high wind loads to supporting walls. Sizes available for 1-ply, 2-ply, 3-ply and 4-ply trusses.

Materials: See chart

Finish: G90 galvanizing

Codes: Factored resistances are derived from data submitted to various North American building code evaluators and are in accordance with CSA 086-14.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- All fastener holes must be filled with specified fasteners to achieve loads listed in the chart. Large fastener holes are for concrete/masonry installations (reference page 168) and do not need to be filled when used for girder-to-stud applications.
- WS Wood Screws included with LUGT3 and LUGT4.

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) Factored resistances apply where roof pitch is between 3:12 and 8:12.

3) Additional anchorage products to be designed by others.

4) For proper installation, the number of studs must be equal-to or greater-than the number of roof truss plies.

5) The LUGT1 can be installed with the stud offset from the rafter a maximum of 1" (center-to-center) with no reduction in uplift capacity.

6) NAILS: 8d x 1-1/2 are 0.131" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, 16d Sinkers are 0.148" dia. x 3-1/4" long, WS25 Wood Screws are 1/4" dia. x 2-1/2" long (supplied with LUGT3) and WS3 Wood Screws are 1/4" dia. x 3" long (supplied with LUGT4).

New products or updated product information are designated in blue font.

Designed for higher uplift resistance for wood frame construction.
The MUGT15 can accommodate variable truss bearing depths.

Materials: 12 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- When straps are wrapped over the truss, install nails in backside of truss. See MUGT15 installation diagram for minimum nail requirements into the face and on top of the truss.
- If installed straight-up with no wrap over the top of the truss, fill all nail holes.
- **Moisture barrier may be required.**

USP Stock No.	Ref. No.	Steel Gauge	Mounting Condition	Fastener Schedule ²						DF Factored Resistance		S-P-F Factored Resistance

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) Additional anchorage products to be designed by others.

3) Designer must specify anchor bolt type, length, and holdown device.

4) **NAILS:** 10d nails are 0.148" dia. x 3" long.

Typical MUGT15 top-min installation with PHD4A

MUGT15

Typical MUGT15 connection to support beam

HUGT Girder Tiedowns

The HUGT series high uplift girder tiedowns can be installed on beams and top chords of trusses with slopes from 0° to 34°.

Materials: 7 gauge

Finish: USP primer

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Install the HUGT over the beam or truss (see "W" dimension on chart for appropriate width).
- Install (4) LBP58-TZ washers if (2) 5/8" tension bolts are used.
- Attached members shall be designed to resist applied loads.
- **Moisture barrier may be required.**

Typical HUGT3 installation with HTT45's

HUGT

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) Factored resistances apply where roof pitch is between 3:12 and 8:12.

3) Additional anchorage products to be designed by others.

4) Designer must specify anchor bolt type, length, and holdown device.

5) **NAILS:** 10d nails are 0.148" dia. x 3" long.

These anchors tie trusses and rafters to top plates and may be used to tie wood framing members to resist uplift and lateral forces.

Materials: See chart

Finish: G90 galvanizing;
HHCP4-TZ – G-185 galvanizing.

Options: See chart for Corrosion
Finish Options

Codes: Factored resistances are derived from data submitted to various North American building code evaluators and are in accordance with CSA 086-09.

AVAILABLE IN
**GOLD
 COAT**

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- All nail holes must be filled with specified nails to achieve loads listed in the chart. For substituting with different nail sizes, refer to "Optional Nails" on page 19 or consult a design professional.
- Depending on pitch, birdsmouth notching may be required with some models to enable installers to fill all nail holes. Consult a design professional for appropriate notching.
- Designer shall determine if solid blocking is required.
- LFTA6, RT4, RT5, and RT7 ship in equal quantities of left and right versions. Left version images shown.

RUSC Retrofit Strap Connector

The RUSC Retro Uplift Strap Connector provides a wood-to-wood uplift connection attaching trusses with a 2 x 4 bottom chord to a double stud in the wall below. WS3 Wood Screws are utilized for fast installation. The connector can be installed after roof sheathing has been installed.

Materials: 10 gauge

Finish: USP primer

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- **The RUSC shall be installed in pairs.**
- Install on minimum 2 ply with equal wall studs centered directly below.
- Works with 2 x 4 bottom chord member and 2 x 4 wall studs.

Typical RUSC
installation

RUSC

USP Stock No.	Ref. No.	Steel Gauge	No. of Plies ⁵	Fastener Schedule ^{3,4}				DF		S-P-F	
				Rafter/Truss		Stud		Factored Resistance		Factored Resistance	
				Qty	Type	Qty	Type	Uplift 115% ^{1,2}		Uplift 115% ^{1,2}	
								Lbs	kN	Lbs	kN
RUSC	-- --	10	2 Ply or greater	16	WS3	16	WS3	6250	27.80	5410	24.07

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase is allowed.

2) Designer must specify stud or post to resist published load values.

3) WS3 Wood Screws are 1/4" x 3" long and are included with RUSC connectors.

4) Fastener schedule is for two straps used together. The RUSC shall be installed in pairs with a minimum 2 ply truss and wall stud attachment.

5) Truss plies shall be fastened together to act as a single unit.

THDS26 hangers can be used to support headers, joists and trusses in medium load conditions. An open back design allows installation after a member is placed in position.

Materials: 18 gauge

Finish: G90 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.

Typical THDS26
installation

1) Factored uplift resistances have been increased 15% for short-term loading such as wind and earthquake; reduce for other load durations in accordance with the code.

2) When used in a truss application, the fasteners into the supported member will need to be driven through the truss plate to complete the installation.

3) Where truss plate is not within 1/4" of bottom surface use values for 2x6 S-P-F joist.

4) Supporting and supported wood members are to be designed by others. Ensure supporting member can accept all fasteners.

5) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 16d x 2-1/2 nails are 0.162" dia. x 2-1/2" long.

New products or updated product information are designated in **blue font**.

The MUS / HUS hanger series offers double shear nailing. USP's raised dimple allows for 30° to 45° nailing through the joist into header, resulting in higher loads and less nailing.

Materials: MUS – 18 gauge; HUS – 16 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Joist nails must be driven in at a 30° to 45° angle through the joist or truss into the header to achieve listed loads. **Standard length "double shear" nails must be used to achieve listed load values.**
- See EWP applications page 135.

Typical HUS installation
(MUS similar)

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

Specialty Options Chart – refer to Specialty Options pages 220-221 for additional details.

Option	Skewed ^{1,3}	Sloped Seat ²	Sloped / Skewed ^{1,2,3}	Inverted Flange
Range	1° to 45°	1° to 45°	See Sloped Seat and Skewed	Not available in widths < 3". Widths > 3" can have one flange inverted.
Factored Resistance	85% of table load	65% of table load	65% of table load	100% of table load. 65% of table load when nailing into the support members end grain.
Ordering	Add SK, angle required, right (R) or left (L), and square cut (SQ) or bevel cut (BV) to product number. Ex. THD410_SK45R_SQ	Add SL, slope required, and up (U) or down (D), to product number. Ex. THD410_SL30D	See Sloped Seat and Skewed. Ex. THD410_SK45R_SQ_SL30D	Add 1IF, one flange, right (R) and left (L), to product number. Ex. THD410_1IFR

- 1) Skewed hangers with skews greater than 15° may have all joist nailing on outside flange.
 - 2) Sloped or sloped / skewed hangers with slopes greater than 15° may have additional joist nails.
 - 3) For skewed hangers, the required cut type (square or bevel) of joist member may vary based on skew angle and width of hanger. Some square cut hangers will require custom pricing due to welded back plate.
- New products or updated product information are designated in **blue font**.

Materials: 12 gauge**Finish:** G90 galvanizing**Options:** See chart for Corrosion Finish Options**Codes:** Load values are derived from data submitted to various North American building code evaluators.**Installation:**

- Use all specified fasteners. See Product Notes, page 15.
- Joist nails must be driven in at a 30° to 45° angle through the joist or truss into the header to achieve listed loads. **Standard length "double shear" nails must be used to achieve listed load values.**
- See EWP applications pages 135-136.

**Typical THDH double shear installation****Typical THDH26-2 installation****THDH**

Drive joist nails into header at 30° to 45° to achieve listed loads.

Specialty Options Chart

– refer to Specialty Options pages 220-221 for additional details.

Option	Skewed ^{1,3}	Sloped Seat ²	Sloped / Skewed ^{1,2,3}
Range	1° to 45°	1° to 45°	See Sloped Seat and Skewed
Factored Resistance	85% of table allowable load. 50% of table uplift load.	85% of table allowable load	52% of table allowable load. 50% of table uplift load.
Ordering	Add SK, angle required, right (R) or left (L), and square cut (SQ) or bevel cut (BV) to product number. Ex. THDH410_SK45R_BV	Add SL, slope required, and up (U) or down (D), to product number. Ex. THDH410_SL30D	See Sloped Seat and Skewed. Ex. THDH410_SK45R_BV_SL30D

1) Skewed THDH hangers with skews greater than 15° always have all joist nailing on one side of the outside flange.

2) Sloped or sloped / skewed hangers with slopes greater than 15° may have additional joist nails.

3) **Skewed hangers typically require a bevel cut. A square cut option may be available as a custom.**

Inverted flange option is not available for THDH models.

New products or updated product information are designated in **blue font**.

Some model designs
may vary from
illustration shown

The new THDHQ hangers are designed to attach multi-ply girder trusses together using USP's WS Wood Screws for higher design load capacity. THDHQ hangers can also be used to attach structural composite lumber (SCL).

Materials: 12 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners.
- WS Wood Screws are supplied with THDHQ hangers.
- See table footnotes.

**Typical THDHQ28-2
truss installation**

**Typical THDHQ28-2
SCL installation**

4 x 10 - 12	THDHQ410	HGUQ410-SDS3	3-5/8	9-3/16	4	2-13/16	28	WS3	8	WS3	Lbs	16195	9695	12715	8075
											kN	72.04	43.13	56.56	35.92

- 1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.
 - 2) WS3 is 1/4" x 3" long wood screw, WS45 is 1/4" x 4-1/2" long wood screw, WS6 is 1/4" x 6" long wood screw and are included with THDHQ hangers.
 - 3) WS Wood Screw length into supporting member is based on supporting member width being equal to supported member width. See notes 4 and 5 for fastening information.
 - 4) WS Wood Screws shall penetrate properly into all plies of the supporting member and as a minimum, penetration into the last ply of the supporting member shall be at least one inch. Additional WS screws (not supplied) can be installed to the back side of the outer ply, designed by others, when the aforementioned penetration requirement is not met.
 - 5) For construction safety concern, if the supplied WS Wood Screws protrude past the last ply of the supporting member, shorter length WS screws can be used; ex. WS3 screws may be substituted for WS45 screws and WS45 screws may be substituted for WS6 screws, with no load reduction. Alternately, a backer block member may be used as determined by the designer.
 - 6) Cross-grain tension may limit factored resistances per CSA 086-14 Section 12.2.1.4. For assistance, contact USP Structural Connectors.
 - 7) WS Wood Screws may be installed through metal truss connector plates as approved by the Truss Designer, provided the requirements of CSA 086-14 Section 5.3.8 and TPIC-2014 Section 7.5 are met. (Pre-drilling required through the plate using a maximum of 5/32" bit).
 - 8) For hanger installations supported by LSL, of specific gravity no less than 0.50, use the DF factored resistances.
- New products or updated product information are designated in **blue font**.

The MSH is field adjustable. The flanges can be used in top mount, face mount, or combination installations. An open back design allows installation after a member is placed in position.

Materials: See chart

Finish: G90 galvanizing

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Web stiffeners are required for I-Joist installations.

MSH

Mounting Conditions

Face Max

All header nails used should be driven into the wide face of the header.

Typical MSH
face-max installation

Top-Max

The hanger is installed in a top mount condition with at least six lower header face nail holes filled, and four top flange nails filled. The strap must wrap over the top at least 2-1/2".

Typical MSH
top-max installation

Top-Min

The hanger is installed in a top mount condition with at least the top two header face nail holes filled, and four top flange nails filled. The strap must wrap over the top at least 2-1/2" and the joist nails shall be installed straight into the joist for all models.

Typical MSH
top-min installation

Combination Face-Max / Top-Max

Face-Max values apply for the entire connection. Follow fastening directions above for the applicable mounting condition for each individual flange strap.

Typical MSH
combination installation

The MSHL/R is a versatile 45-degree skewed hanger with multiple installation options. It can be installed on a supporting girder truss as well as solid-sawn and structural composite lumber headers.

Materials: See chart

Finish: G90 galvanizing

Installation:

- Install the required number of fasteners according to the load table.
- Install fasteners into the carrying members at the locations described below based on the proper "Mounting Condition."
- Web stiffeners are required for I-Joist installations.
- Hanger is factory skewed at 45° left or right.

Right skew

Left skew

Typical MSH213R installation
right skew

Typical MSH213L installation
left skew

CONNECTION TO CARRYING MEMBER Mounting Condition

Face-Max

For MSH422L/R, bottom six (6) fastener holes (three on each side of bucket) must be filled. Install eight (8) additional fasteners (four (4) in each strap) where applicable. For MSH213L/R, bottom eight (8) fastener holes must be filled (four (4) in each strap). Install fourteen (14) additional fasteners, seven (7) in each strap. Min. 2x6 bottom chord required.

Typical MSH422R
face-max installation

Top-Max

The straps must be field-bent over the header a minimum of 2" to allow four (4) top flange nail holes to be filled (two in each strap). The bottom six (6) fastener holes (three on each side of the bucket) must be filled. Min. 2x6 bottom chord required.

Typical MSH422R
top-max installation

Top-Min

The straps must be field bent over the header a minimum of 2" to allow four (4) top flange nail holes to be filled (two in each strap). Also install the two (2) uppermost face nails (one on each strap) near the top of the header.

Typical MSH422R
top-min installation

Combination Face-Max/Top-Max

Follow the Face-Max installation for one side of the connector and the Top-Max installation for the opposite side of the connector. The Face-Max factored resistances apply to this type of installation. Min. 2x6 bottom chord required.

Typical MSH422R
combination installation

CONNECTION TO CARRIED MEMBER - All Mounting Conditions

Install six (6) 10d x 1-1/2" nails into 2x carried member, or six (6) 10d nails into 3-1/2" wide carried member.

1) Factored uplift resistances have been increased 15% for short-term loads such as wind or earthquake; reduce for other load durations in accordance with the code.

2) **NAILS:** 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long

New products or updated product information are designated in **blue font**.

USP's MSHA Series hanger offers the most flexible field solution for truss-to-truss connections accommodating a range of skews and challenging web-chord geometry often found in truss framing. Eliminating the need for special orders, the MSHA Series hanger provides economical solutions for 1-ply or 2-ply roof trusses and 1-ply floor trusses skewed between 22-1/2° to 75°. MSHA hangers can be installed in top-min, top-max, face-max or combination conditions as required.

Materials: 16 gauge

Finish: G90 galvanizing

Installation:

- Install the required number of fasteners according to the load table.
- Install fasteners into the carrying member at the locations described below based on the proper "Mounting Condition".
- Product is factory skewed 22-1/2° and may be field skewed from 22-1/2° to 75°. See installation sequence below for skews greater than 22-1/2°.
- Face-Max and Combination mounting conditions require a minimum chord or header height of 7-1/4". Top-Max and Top-Min mounting conditions require a minimum chord or header height of 5-1/2".

MSHA29L
Left Shown

MSHA29R-2
Right Shown

CONNECTION TO CARRYING MEMBER
Mounting Conditions:

Face-Max

Fill the lowest four holes nearest each side of the bucket. For a 22-1/2° skew, fill the four diamond holes on one side and 4 round holes on the other. For skews greater than 22-1/2°, fill the 4 round holes on each side.

Add an equal amount of nails in each side of the hanger in any of the remaining nail holes to meet the minimum fastener requirements listed in the table on page 187.

Typical MSHA
face-max installation

Top-Max

Field bend the strap over the supporting member. The bent strap must extend a minimum of 2 inches over the carrying member to allow for the four top flange nail holes to be filled.

Fill the lowest four nail holes nearest each side of the bucket. For a 22-1/2° skew, fill the four diamond holes on one side and 4 round holes on the other. For skews greater than 22-1/2°, fill the 4 round holes on each side.

Typical MSHA
top-max installation

Top-Min

Field bend the strap over the supporting member. The bent strap must extend a minimum of 2 inches over the carrying member to allow for the four top flange nail holes to be filled.

Fill the four nail holes (two each strap) nearest the top of the carrying member.

Typical MSHA
top-min installation

Combination
(Face-Max/Top-Max)

Follow the Face-Max installation for one side of the connector. Follow the Top-Max installation for the opposite side of the connector.

The Face-Max factored resistance apply to this type of installation.

Typical MSHA
combination installation

CONNECTION TO CARRIED MEMBER
Mounting Conditions:

For the 22-1/2° skew installation, all round and diamond holes must be filled.
For skews greater than 22-1/2°, only the diamond holes must be filled.

Installation Sequence for Skews > 22-1/2°

Step 1: Install acute side top and/or face header fasteners.

Step 2: Utilizing a piece of scrap fastened to the hanger on the obtuse side, bend the hanger to the desired angle.

Step 3: Bend the obtuse side of hanger back toward the header until the flange lies flat against the header, and install header top and/or face fasteners as noted above.

Step 4: Install carried truss and all required fasteners working from the bottom up.

1) Factored uplift resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) H_{eff} is the minimum distance from the top of the hanger seat to the top of the carrying member.

3) For tabulated top-mount installation loads, the straps must be wrapped over the header a minimum of 2".

4) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long.

New products or updated product information are designated in **blue font**.

USP's MSSH217 hanger accommodates a skew range of 60° to 85° (5° minimum to 30° maximum off the girder) without the need for a more expensive custom design hanger. Face nail to webs or bend the flange strap over the chord. Available in left (L) or right (R) configurations.

Materials: 18 gauge

Finish: G90 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- The 3 lower holes on each strap are for top nailing when the strap is bent over the truss chord. These holes are not for face nailing.
- One or both straps may be bent over the bottom chord of the girder with top and backside nailing.
- **Note:** Select the correct (right or left) hanger so that the strap on the outside of the angle will pass the end of the truss. When facing the hanger, the strap in the rear turns in the direction of the skew. The front strap turns to pass behind the end of the carried member.
- Attach the hanger at the end of the truss with a single 10d (0.148" dia) x 1-1/2" nail into the side flange or bottom.
- Place the truss in position against the girder. Push the outside strap past the end of the truss to the girder web and face nail through the top 8 holes with 10d (0.148" dia) x 1-1/2" nails into the girder.
- The strap inside the angle can be formed over diagonal webs (if design allows) or bend over the girder chord. Use two nails into the top and fill all nail holes on the front/back side of the girder.
- If the outside strap does not contact a web, bend the strap tightly over the girder chord. Use two nails into the top and fill all nail holes on the back side of the girder.
- For uplift resistance, other means of attachment are required. If both the truss and girder have vertical webs, attach a scab to pack out the girder web nearly flush with the truss web and use a field adjustable MP framing angle across the two. A top chord connection for uplift requires a flat LSTA strap tie wrapped under the girder and over the truss chord.

			top-min	2	10d	3	10d x 1-1/2	1	10d x 1-1/2		2115	9.41	1720	7.65

1) No uplift value with this hanger. Use other hardware higher on carried member to counteract uplift.

2) One or both straps may be bent over chord member with top and backside nailing.

3) Maintain minimum 3/4" edge distance when installing nails.

4) The supported member shall be supported by blocking or other means to prevent rotation.

5) **Nails:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" x 3" long.

Note: The lower holes on each strap are for top nailing when strap is bent. These holes are not for face nailing.

The SNP3 Skewed Nail Plate is designed and tested for connecting square cut corner jack trusses at skew angles up to 45°.

Materials: 16 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Install specified fasteners from bend line out from each end. Not all nail holes will be filled.
- Attach to the supported truss on the acute angle side so the SNP3 runs behind the end of the jack.
- Set jack truss against supporting truss and nail on exposed flange.
- **Bend angle only once.**
- 8d common (0.131" dia. x 2-1/2" long) nails may be substituted for 8d x 1-1/2" nails with no reduction in load.

Typical SNP3 installation

HHC / HJC / HJHC / HTHJ Hip / Jack Connectors

HHC – Designed to support hip/hip and jack truss/rafter. Contact USP when using in multi-ply applications.

HJHC – Allows for hip/hip support and hip/jack/hip installations.

HJC & HTHJ – Used to simultaneously hang a combination of hips and jacks off girder trusses. These hangers fit both left-hand and right-hand applications. An open back design allows for retrofit installations.

Materials: HHC, HJC, & HJHC – 12 gauge, HTHJ – 18 gauge

Finish: G90 galvanizing

Options: See Specialty Options Chart on page 190.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.

Factored Resistance	100% of table load
Ordering	Add SK, angle of hip required, to product number. Ex. HJC26_SK55

BN Breakfast Nook Hangers

Designed to carry four mono trusses in one connector, it reduces installation time and cost. Provides a tested, load rated connection. Standard configuration spacing: 22-1/2°, 45°, 45°, 45°, 22-1/2°. The design also includes field adjustable nailing tabs.

Materials: 14 gauge

Finish: USP primer

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Allow a 2" setback for each mono truss.
- For pitched ceiling, design mono trusses with end-vertical upset. Upset equals tangent of the ceiling slope times 5.6".
- **Bend tab only once.**

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) WS3 wood screws are 1/4" x 3" and are included with DSC4 connector.

3) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long.

The GTWS series girder-to-girder hangers feature high uplift capacities along with high gravity load ratings.

Materials: 10 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- WS Wood Screws are included with hangers where specified.
- **GTWS2T** shall be installed to a minimum 2x4 vertical member of a girder truss with no restriction on the size of the bottom chord.
- **GTWS3T** shall be installed to a minimum 2x6 vertical member of a girder truss with no restriction on the size of the bottom chord.
- **GTWS4T** shall be installed to a minimum 2x8 vertical member of a girder truss with no restriction on the size of the bottom chord.

Min. 2x6 vertical
(Min. 3" height truss plates,
flush with hanger seat,
required on end grain verticals
to resist wood splitting)

**Typical GTWS
installation**

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) WS3 wood screws are 1/4" x 3" long and are included with the GTWS hangers.

3) The wood screws of the GTWS hangers may be installed in both vertical and horizontal members.

New products or updated product information are designated in **blue font**.

The GTQ / GTQM hangers connect to multi-ply girder truss with USP's WS Wood Screws offering high load capacities. Design features minimum and maximum fastening installation options to accommodate various sizes of vertical web. GTQM's are designed for LVL sizes, for example GTQM218.

Materials: 7 gauge

Finish: G90 galvanizing

Installation:

- Use all WS wood screws as specified.
- Install hanger centered on vertical web.
- GTQ's are designed to be installed on various sizes of vertical web. Maintain a minimum 5/8" fastener edge distance as per the National Design Specification where truss connector plates are not present.
- Install WS wood screws in all fastener holes including diamond holes for maximum values.

GTQM420	-- --	7-1/4	20	5-3/4	Min	2x8	41	USP WS (See Footnote 3)	3	20	WS6	4	Lbs	26035	8835	20440	6935	
					Max	2x10	47	USP WS (See Footnote 3)	3	20	WS6		kN	115.81	39.30	90.92	30.85	

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) WS3 is 1/4" x 3" long wood screw, WS45 is 1/4" x 4-1/2" long wood screw, WS6 is 1/4" x 6" long wood screw and are included with GTQ and GTQM hangers.

3) When fastening to a multi-ply supporting truss: use WS3 for 2-ply, WS45 for 3-ply and WS6 for 4-ply.

4) WS Wood Screws may be installed through metal truss connector plates as approved by the Truss Designer, provided the requirements of CSA 086-14 Subsection 5.3.8.

and TPIC-2014 Section 7.5 are met. (Pre-drilling required through the plate using a maximum 5/32" bit).

5) Truss plies of the supporting member must be fastened together to transfer the load (through all truss plies) that is not transferred by the hanger screws; fastening schedule is to be specified by the truss designer.

6) Supported members on GTQM hangers shall have Specific Gravity of not less than 0.46.

7) The span of the supported member shall be shortened by 1/2" at the hanger end to allow space for screw head and back plate (7 ga).

New products or updated product information are designated in **blue font**.

The GT primarily hangs girder trusses off other girder trusses, although a wide variety of other heavy-duty installations apply.

Materials: Back Plate – 3 gauge; Strap – 7 gauge

Finish: USP primer

Options: All models available in LVL sizes, use M in place of T, as in GT2M4B.

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Minimum heel height is 9-1/4" for GT hangers.

1) Factored uplift resistance has been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) Bolts shall conform to ASTM A 307 Grade A or better.

3) GT series require 2 x 6 vertical member for 2, 3, and 4 bolt hangers and 2 x 8 for 6 and 8 bolt hangers.

4) **NAILS:** 16d nails are 0.162" dia. x 3-1/2" long.

New products or updated product information are designated in **blue font**.

1) Factored resistance for GTS and GTD is the total of hip and jack connection.

2) Factored uplift resistance has been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

3) Bolts shall conform to ASTM A 307 or better.

4) GT Series require 2 x 6 vertical member for 2, 3, and 4 bolt hangers and 2 x 8 for 6 and 8 bolt hangers.

5) All side pocket applications assume 45° angle.

6) Must specify right or left for all GTS and GT skewed.

7) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 16d nails are 0.162" dia. x 3-1/2" long.New products or updated product information are designated in **blue font**.

Backer block installation

Wood blocking used to achieve full design load value of a face mount hanger attached to a carrying member. **(Blocking to be designed by truss designer or engineer of record).**

- Wood blocking should be of similar size/grade as the truss member to which it is attached. The blocking should be designed to act as one unit with truss members.
- Truss designer shall approve blocking size/grade, fasteners required, and application.
- All fasteners used to attach wood blocking should be independent of the fasteners in the truss hanger.

Panel joint installation

Connection with face mount hanger attaching to a truss panel joint.

- Hanger nails that do not penetrate wood at panel joint provide no load resistance; reduce listed factored resistance accordingly.

Filler block installation

Wood filler blocking used for supported member of width less than hanger width. **(Blocking and blocking fasteners/quantity to be designed by truss designer or engineer of record).**

- Wood blocking should be of similar or better grade as the truss member to which it is attached. The blocking should be designed to act as one unit with truss member.

TRUSS BRACE & SPACER (STABILIZER™)

The Stabilizer™ Truss Brace & Spacer provides temporary construction bracing in the roof and ceiling planes, as well as permanent lateral bracing for webs as specified by your truss engineering.

The Stabilizer™ is easily installed by embedding the patented MII 20 teeth on the top flange straight into the edge of the truss member to be braced with a framing hammer. The side tabs are then secured by driving the teeth into the face of the truss member being braced.

Materials: 20 gauge

Finish: G60 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use 31-16 for standard 16" o.c. spacing and 31-24 for standard 24" o.c. spacing. For odd spacing, cut and insert a solid block between the trusses.
- Typically, The Stabilizer™ is installed at 6'– 8' centers along the roof plane and 10'– 15' along the ceiling plane. (Refer to engineering specifications BCSI 1-03, published by The Truss Plate Institute for specific bracing requirements.)
- The Stabilizer™ must be supplemented with diagonal bracing in the roof and ceiling planes and cross bracing in the web plane at required intervals.
- Web forces are not to exceed 8000 lbs.
- The Stabilizer™ is properly installed when the top flap and side tabs are flush with the member being braced.

Important: The erection contractor is responsible for determining and installing the temporary bracing for the structure, including the trusses. It is most important for the installer to provide adequate means for bracing the first truss installed. The performance of the entire bracing system depends on the adequacy of the ground bracing or other means of bracing the first group of trusses installed. The building designer is responsible for the permanent bracing design of the overall structure including the truss. This includes the design of required supplemental diagonal and cross bracing.

installation

USP Stock No.	Ref. No.	Steel Gauge	O.C. Spacing (in)	Factored Axial Loads (Lbs.)		
				Tension	Tension with Fastener	Compression
31-16	TSBR2-16	20	16	152	222	608
31-24	TSBR2-24	20	24	152	222	608

1) 1 pound = 4.448N

2) Fastener shall be (1) 8d or 10d common wire nail inserted through nail slot.

3) **NAILS:** 8d nails are 0.131" dia. x 2-1/2" long, 10d nails are 0.148" dia. x 3" long.

Truss spacers give framers fast and accurate spacing for trusses, rafters, or floor joists. The TS and TSX eliminate the need to mark layouts on bearing plates, improve installation speed, and help eliminate spacing errors. These spacers are light weight and compact.

Materials: See chart

Finish: G90 galvanizing

Installation:

- Use (1) 8d nail per end to fasten units to trusses, rafters, or floor joists.

Important: These units provide spacing guides only. Do not rely on the TS or TSX for bracing.

Typical TSX installation

TS single-unit spacer

TSX multi-unit spacer

Joist Width	USP Stock No. ¹	Ref. No.	Steel Gauge	O. C. Spacing	Overall Length	Sections Per Piece
1-1/2	TS	-- --	20	24	2' 1-1/2"	1
	TSX16	TSF2-16	22	16	8'	6
	TSX24	TSF2-24	22	24	10'	5

1) TSX spacers are shipped folded.

SBP Supplementary Bearing Plates

Use the SBP instead of extra truss plies or nail-on scabs to distribute concentrated truss reactions and avoid top plate crushing. The two-piece design accommodates any number of girder plies. A wraparound design gives superior uplift resistance, and reinforcement ribs effectively distribute bearing loads. Works with both single and double 2x4 or 2x6 top plates.

Materials: 16 gauge

Finish: G90 galvanizing

Codes: Factored resistances are derived from data submitted to various North American building code evaluators and are in accordance with CSA 086-09.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- The SBP shall be installed in pairs.

Wood Species	f _{cp} (psi)	No. of Truss Plies	Factored Resistance (Lbs)			Factored Resistance (kN)

- 1) Factored resistance is for a pair of SBP devices.
- 2) Multiple ply trusses shall be fastened together to act as a single unit.
- 3) EBL denotes effective bearing length and includes the actual bearing length plus the contribution of the SBP device.
- 4) Assumes full seating of truss on top plate.

Typical SBP installation

Typical SBP6 one tab up on a 2x8 top plate installation (SBP4 similar)

- 1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase is allowed. For standard term loads divide the values by 1.15.
 - 2) Fastener schedule is for a pair of SBP devices.
 - 3) Factored resistances are for a pair of SBP devices.
 - 4) Multiple ply trusses shall be fastened together to act as a single unit.
 - 5) Where truss sits on a single top plate, 10d x 1-1/2 nails may be used on the top side of the top plate.
 - 6) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long.
- New products or updated product information are designated in **blue font**.

FTC clips slide easily onto the top or bottom chord and provides a guide to help position and support the second truss during assembly.

FTCT clips easily install after the trusses are installed.

Materials: 18 gauge

Finish: G90 galvanizing

Codes: Factored resistances are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- The truss designer must determine the number of clips required and the spacing between clips based on loading conditions.

Concentrated Load Condition: (Side-loaded onto a 2-ply truss):

- The FTC clips shall be installed in pairs, or multiples of two, on either side of, and within 12" of a concentrated load.
- Divide half of the concentrated load by the clip capacity to determine the number of clips required.

Example:

Concentrated (point) load = 3000 lbs, FTC1 capacity (SPF) = 1080 lbs

$$\frac{1/2 (3000 \text{ lbs})}{1080 \text{ lbs}} = 1.4 = 2 \text{ clips}$$

Install two FTC1 clips, one on each side of, and within 12" of concentrated load.

Uniform Load condition (side-loaded onto a 2-ply truss):

- To transfer uniform loads to the second ply, the FTC clips shall be installed at a regular interval along the loaded chord. Spacing between clips is limited to 24" maximum.
- Divide the clip capacity by half the required load per lineal foot (PLF) to determine the spacing between clips.

Example:

Uniform distributed load = 500 PLF.

FTC1 capacity (SPF) = 1080 lbs

$$\frac{1080 \text{ lbs}}{1/2 (500) \text{ PLF}} = 4.32' \text{ spacing}$$

Space clips at 24" (MAX) along the loaded chord.

									kN	5.54	4.80

1) Factored transfer resistances are for 100% floor load, and shall not be increased for short term load duration.

2) Truss designer shall determine the number of clips for concentrated loads and the spacing for uniform loads.

3) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long.

The STC provides uplift resistance by securing trusses to top plates. Slotted nail holes allow for horizontal movement up to 1-1/4" as scissor trusses deflect.

Materials: 12 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- When installing, do not fully set nails.
- Locate nails into the center of slots to allow for horizontal movement.

Typical STC installation

STC

1) Factored resistances have been increased for short-term loading; no further increase is allowed.

2) Truss must be bearing on top plate to achieve the factored resistances under "Without Gap".

3) Installed with maximum 1/4" space between rafter or truss and top plate under "With 1/4" Gap". Space is not limited to 1/4", where resistances are not required.

4) Installed with maximum 1/2" space between rafter or truss and top plate under "With 1/2" Gap". Space is not limited to 1/2", where resistances are not required.

5) To achieve F1 loads in both directions, clips must be installed on both sides of the truss and staggered to avoid nail interference.

6) **NAILS:** 8d nails are 0.131" dia. x 2-1/2" long.

New products or updated product information are designated in **blue font**.

Slotted design allows truss to deflect without imposing load on wall below.

Materials: 16 gauge

Finish: G90 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Do not fully set nails.

Typical HTC4 installation

HTC4

USP Stock No.	Ref. No.	Steel Gauge	Fastener Schedule ⁵				Unit	DF Factored Resistance ¹				S-P-F Factored Resistance ¹			
			Plate		Truss/ Rafter	Type		Without Gap ²		With 1-1/4" Gap ³		Without Gap ²		With 1-1/4" Gap ³

										kN	-- --	-- --

- 1) Factored resistance shall not be increased for other load duration factors.
 - 2) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long.
- New products or updated product information are designated in **blue font**.

Deck Tie Back reinforces the connection of rail posts to a deck.
 Also provides lateral strength of deck-to-ledger attachment by securing deck to house framing.

Materials: 14 gauge

Finish: G-185 galvanizing

Options: See chart for Corrosion Finish Options

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Install with USP's THR 1/2" threaded rod or equivalent.
- Drive WS15-HDG wood screws into joist.
- Re-install threaded rod or anchor bolt. Secure with washer and nut.
- Tighten anchor bolt nuts finger tight snug to base plus 1/3 to 1/2 additional turns with wrench.

Typical DTB-TZ installation

Typical DTB-TZ Deck to ledger installation

DTB-TZ

USP Stock No.	Ref. No.	Steel Gauge	Rod / Bolt Anchor Dia. (in)	CL (in)	Fastener Schedule ²		DF Factored Resistance				S-P-F Factored Resistance				Corrosion Finish

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; reduce for other load durations in accordance with the code.

2) WS15-HDG Wood Screws are 1/4" dia. x 1-1/2" long and are included with DTB-TZ Deck Tie-Backs.

New products or updated product information are designated in **blue font**.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

SDPT Strap Post Ties

Connects 2 x 4 stair posts and 4 x 4 posts to deck rim joist or stair stringers.

Materials: 14 gauge

Finish: G-185 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Install units in pairs on 2x4 (SDPT5-TZ) or 4x4 (SDPT7-TZ) post. Space the connectors 5" apart from center to center on the post. Use through bolts to fasten connectors to rim joist or stringer. Do not use lag bolts. Fasten to post with specified nails (see chart).

Typical SDPT7-TZ installation

SDPT7-TZ

Post Size	USP Stock No.	Ref. No.	Steel Gauge	Fastener Schedule ^{1,2}				Corrosion Finish
				Qty	Type	Qty	Type	
2 x 4	SDPT5-TZ	DPT5Z	14	5	10d x 1-1/2 HDG	2	3/8 HDG	
4 x 4	SDPT7-TZ	DPT7Z	14	5	10d x 1-1/2 HDG	2	3/8 HDG	

1) Bolts shall conform to ASTM A 307 or better.

2) **NAILS:** 10d x 1-1/2" nails are 0.148" dia. x 1-1/2" long.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

SDPT5-TZ

CSH Concealed Stringer Hanger

The CSH-TZ concealed stringer hanger provides a method of connecting a stair stringer with a hidden hanger. The seat of the hanger is adjustable to match the slope of the stair stringer.

The reversible design allows the connector to be used on the left, right, or interior stringers. The CSH-TZ may be used with USP's SCA Stair Angles for a complete, easy-to-use stair framing solution.

Materials: 18 gauge

Finish: G-185 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Bend angle only once.

Steps:

1. Attach CSH-TZ to header with tabs positioned towards the inside of the stringer member.
2. Adjust the seat of the CSH-TZ to match the slope of the stringer member. Diamond shaped holes in the connector allow temporary installation of wood screws to aid in installation of the CSH-TZ.
3. Install 10d x 1-1/2" nails into the stringer and header members.

Typical CSH-TZ installation

CSH-TZ

USP Stock No.	Ref. No.	Steel Gauge	Fastener Schedule ²				DF Factored Resistance				S-P-F Factored Resistance				Corrosion Finish

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase is allowed.

2) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

SDJT Joist Tie

Secures 2x joists to posts.

Materials: 14 gauge

Finish: G-185 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Use with 2x lumber for joists (minimum height is 2x4). Install with either specified nails or through bolts. Do not use lag bolts. To ease installation, attach to 4x4 post first.

Typical SDJT14-TZ installation

SDJT14-TZ

Post Size	USP Stock No.	Ref. No.	Steel Gauge	Fastener Schedule ^{1,2}		Unit	DF Factored Resistance	S-P-F Factored Resistance	Corrosion Finish
				Qty	Type		100%	100%	
							Lbs	Lbs

						kN	7.18	6.03	
				2	3/8 HDG	Lbs	2015	1695	
						kN	8.96	7.54	

1) Bolts shall conform to ASTM A 307 or better.

2) **NAILS:** 16d nails are 0.162" dia. x 3-1/2" long.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

Stair angles simplify stair construction. There is no need to calculate and notch stair stringers. Stronger and safer than wood blocking, and the angle and fasteners are hidden from view.

Materials: 12 gauge

Finish: G-185 galvanizing

Codes: Load values are derived from data submitted to various North American building code evaluators.

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Use the SCA9-TZ for single 2x10 stair treads. Use the SCA10-TZ for double 2 x 6 stair treads.
- To calculate stair construction do the following:
 1. Find the number of steps needed by taking the vertical drop from the deck surface to grade. Divide by 7. Round off to the nearest whole number. (Ex: Vertical drop of 39" divided by 7 equals 5.57" rounded off is 6")
 2. Find the step rise by dividing the vertical drop by the number of steps (39" divided by 6 = 6.5")
 3. Find the step run by measuring the depth of your tread board (Ex: (2) 2x6s have a run of 11-1/4")
 4. Find the stairway span by multiplying the run by the number of treads minus one (Ex: 11-1/4" x 5 = 56-1/4")
- Using the above calculations, mark stair angle locations on each stringer. Attach a stair angle to the inside of each stringer at the marked locations. Attach stringers to deck rim joist and railing posts. Position treadboards on angles and fasten from below.

Typical SCA9-TZ installation

SCA9-TZ

Typical SCA10-TZ installation

AVAILABLE IN
**GOLD

Corrosion Finish  Stainless Steel  Gold Coat  HDG  Triple Zinc

Connects deck boards to joists without face nails or screws. Eliminates rust stains on decks, as well as splintering or wood rot caused by screw or nail "craters". The DC50-TZ works like tongue-in-groove flooring and is easy to install. Raised dimples on the clip provide consistent spacing between deck boards.

Materials: 20 gauge

Finish: G-185 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Fits 1-1/8" or thicker decking.
- Fasten the first deck board onto the joists by toenailing up through the joist below into the deck board. Be sure no sharp points protrude above the deck surface. For subsequent deck board rows, nail DC50-TZ's onto the deck board edge, positioned 2" from each joist. Slide the deck board along the joist until the DC50-TZ "lip" is under the previously laid deck board. Toenail the deck board's exposed edge to the joist. Repeat until decking is completed. The last deck board will require toenailing up from below to secure the outside edge.

**Typical
DC50-TZ
installation**

DC50-TZ

USP Stock No.	Ref. No.	Steel Gauge	Fastener Schedule ^{1,2}		Corrosion Finish
			Qty	Type

									kN	8.41	9.68	5.96	6.87	

1) Factored resistances have been increased 15% for short-term, duration loading; no further increase allowed.

2) USP's WS15 Wood Screws are 1/4" diameter x 1-1/2" long and are not included with angles.

3) For exterior applications use WS15-HDG screws with the hot-dip galvanized finish.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

PRT15-TZ – is for 1-5/8" vertical pipe posts (1-7/8" outside pipe diameter). Can be field bent 90° for outside corner installations.

PRT2-TZ / PRT2H-TZ – is for 2" vertical pipe posts (2-3/8" outside pipe diameter). Can be field bent 90° for outside corner installations.

PRTIC2-TZ – is for inside corner installations. For 2" vertical pipe posts (2-3/8" outside pipe diameter).

Materials: See chart

Finish: G-185 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- PRT15-TZ, PRT2H-TZ and PRTIC2-TZ - 1/4" Self Tapping Bolts are supplied with PRT models.
- Install self tapping bolts with 3/8" socket in pre-drilled holes.
- PRT2-TZ fastens with (1) 1/4" carriage bolt and nut (included) for tightening PRT2-TZ to pipe and (4) 1/4" lag bolts for attaching tie to rail.
- Install 3 to 4 PRT's per pipe.
- PRT15-TZ, PRT2-TZ and PRT2H-TZ may be bent once to fit corner and angled conditions.

Typical PRT2H-TZ installation

1) WS15 wood screws can be substituted for specified lag bolts.

2) Install self tapping bolts (included) with 3/8" socket in predrilled holes.

3) Install 3 to 4 PRT's per pipe.

4) PRT15, PRT2 and PRT2H Pipe Rail Ties may be bent once to fit corner and angled conditions.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

ERB24 – Designed to mount prefabricated fence sections and works with 2x4 horizontal section rails.

FB26 – Secures 2x6 rails to wood posts.

FRB24 – Secures continuous 2x4 rails to wood posts. Pre-punched holes allow installers to splice 2x4 rail ends within the bracket.

Materials: See chart

Finish: G-185 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.

10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long, LL915 denotes a USP LumberLok Screw, #9 x 1-3/8" long.

New products or updated product information are designated in **blue font**.

Corrosion Finish ■ Stainless Steel ■ Gold Coat ■ HDG ■ Triple Zinc

The FPH24-TZ attaches 2 x 4 fence rails to wood posts. The Triple Zinc (G-185) galvanized finish offers superior corrosion resistance in outdoor applications and/or with treated wood.

Materials: 18 gauge

Finish: G-185 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Fasteners need to be Hot-Dip Galvanized for outdoor applications and for use with preservative treated wood.

Typical FPH24-TZ
installation

FPH24-TZ

PCP Plastic Post Caps

These seamless caps keep water off post tops, protecting wood from moisture damage. The PCP's plastic construction is corrosion-proof and paintable. Not available in rough or full lumber sizes.

Materials: Hi-impact plastic

Finish: Gray

Installation:

- Fasten cap to post top with (1) 8d HDG or 10d HDG nail.

Post/Column Size ¹	USP Stock No.	Ref. No.	Dimension (in)	Color
			W	
4 x 4	PCP44	DPPC4BK	3-5/8	Gray
6 x 6	PCP66	DPPC6BK	5-5/8	Gray

1) Not available in rough or full lumber sizes.

Typical PCP44
installation

PCP66

SFP / SMP Fence Post Connectors

Take the work out of fence post installation and repair with the Speedpost, SFP30, and Speedmender, SMP. The Speedpost is used to install 4 x 4 fence posts without digging post holes or pouring concrete. The Speedmender plates act as reinforcement brackets for rotted or damaged 4 x 4 fence posts.

SFP30 – For 6' nominally-sized 4 x 4 fence posts.

SMP – For nominally-sized 4 x 4 posts.

Materials: 13 gauge

Finish: Paint

Installation:

- Step-by-step installation instructions are labeled onto each product.

Post Size	USP Stock No.	Ref. No.	Steel Gauge	Fastener Schedule ^{1,2}	
				Qty	Type
4 x 4	SFP30	FPBS44	13	3	1/4" HDG Lag Bolts
	SMP	FPBM44E	13	20	10d HDG

1) Fastener schedule is per pair of SMP's.

2) **NAILS:** 10d nails are 0.148" dia. x 3" long.

Typical SFP30 installation

SFP30

Typical SMP installation

SMP

BD Bolt Down

Anchors 4 x 4 post to wood or concrete surfaces.

Materials: 13 gauge

Finish: Paint

Installation:

- Use all specified fasteners. See Product Notes, page 15.

RC58	PSCL5/8	18	5/8

Typical RC installation

RC

DC Drywall Clip

Drywall clips or "stops" help support drywall or wood paneling and reduce wood blocking on top plates, end walls, and corners.

Materials: 20 gauge

Finish: G90 galvanizing

Installation:

- Use 8d nails to install DC1, 16" on-center or less.

USP Stock No.	Ref. No.	Steel Gauge	Fastener Schedule ¹	
			Qty	Type
DC1	DS	20	1	8d

1) **NAILS:** 8d nails are 0.131" dia. x 2-1/2" long.

Typical DC1 installation

DC1

IS Insulation Supports

Insulation supports secure batt-type insulation in place between joists. Chisel-cut ends dig into joists for permanent holding. Easy to install in hard-to-reach crawl spaces.

Materials: 13 gauge carbon steel wire

Finish: None

Installation:

- Use IS16 for joist spaced 16" O.C. and IS24 for 24" O.C. spacing.
- Position insulation batt in place between joists. Hold IS unit at the center and push into place.
- Wear gloves and safety glasses during installation.

USP Stock No.	Ref. No.	Steel Gauge	Joist Spacing (in)	Dimensions (in)
				Overall Length
IS16	IS16-R100	13	16" O. C.	15-1/2
IS24	IS24-R100	13	24" O. C.	23-1/2

Typical IS installation

Connectors for home owner /D.I.Y. projects.

TTA12-TZ - an angle connects two 1x wood members at 90° angles.

TTA2-TZ - an angle connects two 2x wood members at 90° angles.

TTB22-TZ - a bracket connects two intersecting 2x wood members at 90° angles.

TTC24-TZ - a corner tie connects 2x wood members at 90° to the corner of a 2x4 post. Mirror design allows for post to be oriented in either direction.

TTC42-TZ - a corner tie connects 2x wood members at 90° to the corner of a 4x4 post.

TTF22-TZ - a bracket connects 2x wood members to opposite sides of a 2x4 or 4x4 post.

TTR-TZ - a clip connects a 2x wood member to the face of another wood member.

TTU2-TZ - a U-clip connects 2x wood members crossing at 90°.

Materials: See chart

Finish: G-185 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- USP LumberLok LL915 (#9 x 1-3/8" long) wood screws are not supplied with connectors.

STS Stud Shoes

Stud shoes reinforce joists, plates, studs, or rafters which have been drilled or notched during construction.

Materials: 16 gauge

Finish: G90 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- **STS units are not structurally rated and should not be used as a total member replacement in structural applications.**
- For use with 2" O.D. pipe.

Typical STS1 installation

STS

USP Stock No.	Ref. No.	Steel Gauge	Description	Dimension (in)	Fastener Schedule ^{1,2}	
				W	Qty	Type
STS1	SS1.5	16	Single Stud	1-9/16	10	10d x 1-1/2
STS2	SS3	16	Double Stud	3-1/16	12	10d
STS3	SS4.5	16	Triple Stud	4-9/16	14	10d

1) Maximum hole size = 2".

2) **NAILS:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, 10d nails are 0.148" dia. x 3" long.

O – The O series spans three joists in under/over installation. Prong teeth in the center help reduce nailing.

N – The N series spans two joists per unit. Can be used for bridging or bracing I-Joists. See chart.

Materials: See chart

Finish: G90 galvanizing

Installation:

- Use specified fasteners in models with fastener requirements.
- Install prior to subfloor sheathing. Use (2) 8d x 1-1/2" nails at each end. Fully seat nails to avoid any movement against the bridging and subsequent floor noise.

USP Stock No.	Ref. No.	Steel Gauge	Dimensions (in)		Fastener Schedule ³		Joist Spacing O.C. (in) ^{1,2}

All models require (2) 8d x 1-1/2 nails at each end.

1) Based on 1-1/2" joist. Consult USP for suitable product for wider joists.

MBG – Grip tooth bridging. Features special teeth which grip joists and provide easy single-nail installation. Can be installed after subfloor is in place.

MB16 – Snap-on, no-nail bridging can be placed in existing floor systems where joist movement is suspected. Two-piece construction creates a solid diagonal brace against joist movement.

Materials: See chart

Finish: G90 galvanizing

Installation:

- Use specified fasteners in models with fastener requirements.
- **MBG** – May be installed before or after sheathing. Position the unbent end of the bridging unit near the top of the joist and drive prongs into wood with a hammer blow to the heel of the bent end. Wedge bent end near the lower edge of the opposite joist, set teeth into wood with hammer blow. Nail holes are provided at the bent end if prongs are damaged during installation. Fully seat nails to avoid any movement against the bridging and subsequent floor noise.
- **MB16** – Two-piece unit is shipped as one piece. Bend unit in center up and down to break into two pieces. Slide narrower piece inside wider piece, setting the end tab into slot appropriate for joist spacing. Setting one prong end near the top of one joist and the opposite prong end near the bottom of the opposite joist, pull down on the center of the bridging until the wider piece snaps into place over the narrow piece and creates a rigid, one-piece bridging unit. Wear gloves during installation.

1) Joist spacing is based on a 1-1/2" joist, consult USP regarding wider joist applications.

2) **NAILS:** 8d x 1-1/2 nails are 0.131" dia. x 1-1/2" long.

MBG

RWB – Flat bracing conveniently packaged in a handy roll out dispenser. Perfect for unexpected job site shortages. The 35-pound dispenser pack fits easily into a truck bed for transport. Pre-embossed snap-off points can be broken off by hand (wear gloves for safety).

WB – A flat style bracing engineered to easily nail to studs. No cutting or fitting needed.

WBC – L-shaped design for additional strength and rigidity.

WBT – Rolled edges and T-style design gives the WBT strength, rigidity, and eliminates sharp, sheared edges.

Materials: See chart

Finish: G90 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- Bracing is a framing aid, not a substitute for structural shearwall components.

- **RWB / WB** – Use with 16" or 24" o.c. studs. Install in pairs forming an "X" or opposing "V" at each end of a maximum 25-foot long wall panel.

Steps: Square the panel. Straighten any kinks in bracing caused by handling. Lay bracing on the panel flush to the top of top plate and flush to the bottom of the bottom plate. Secure bracing to the top plate and bottom plate using 16d nails (WB) or 8d nails (RWB). Position second bracing at an angle opposite to the first brace to form an "X" and secure to top and bottom plate as with the first bracing. Using 8d nails, secure bracing to all intersecting studs.

- **WBC / WBT** – Use with 16" o.c. studs. Install one brace at each end of wall section, not exceeding 25 feet, in an opposing "V" pattern. Use the web portion of a length of bracing as a straight edge to mark studs. Cut a saw kerf 5/8" deep (1" deep for WBC). Insert the bracing web into the saw kerf, and drive one nail into the top plate. Raise the wall section into place and plumb. Finish fastening according to the nail schedule.

SF8

RR Ridge Rafter Hanger

The RR Ridge Rafter supports rafter pitches up to 7:12 (30°). Nesting top flange for installation on 2x support beams.

Materials: 18 gauge

Finish: G90 galvanizing

Installation:

- Use all specified fasteners. See Product Notes, page 15.
- The rafter end at the ridge must be plumb cut to achieve published loads.
- Optional diamond nail holes can be used to fasten RR to end of rafter before setting rafter into place.

Typical RR installation

RR

USP Stock No.	Ref. No.	Steel Gauge	Min Rafter Size	Fastener Schedule ²					DF		S-P-F	
				Header		Rafter			Factored Resistance ¹		Factored Resistance ¹

								kN	3.14	1.53	2.22	1.09

1) Factored resistances have been increased 15% for short-term loads such as wind and earthquake; no further increase allowed.

2) **Nails:** 10d x 1-1/2 nails are 0.148" dia. x 1-1/2" long, LL915 denotes a USP LumberLok Screw, #9 x 1-3/8" long.

New products or updated product information are designated in **blue font**.

KSCT Corner Tie

The Corner Tie secures three-way wood-to-wood connections. Handy for building workbenches, utility tables, or shelving using 2x4 lumber.

Materials: 14 gauge

Finish: G90 galvanizing

Installation:

- Use (12) #10 panhead screws to fasten the KSCT68 to wood framing.

Typical KSCT68 installation

KSCT68

USP Stock No.	Ref. No.	Steel Gauge	Fastener Schedule

The information listed only applies to hangers manufactured by USP Structural Connectors® and installed according to the instructions listed in this catalog. Some of the options listed may not have been evaluated on a single hanger. The designer must always evaluate each connection, including the joist and header capacities, before specifying a specialty connector. USP sloped hangers are manufactured with the plumb cut of the joist already calculated. If a hanger with a different height is needed, it must be specified at the time of ordering.

Materials: Steel gauge may vary from that specified depending on the specialty option and manufacturing process used. Some formed hangers may be welded when modifying the hanger. Hanger configurations, fastener schedules, and height may vary from the tables depending on the joist size, skew, and slope.

Finish: See specific hanger option tables. Welded hangers are painted with USP gray primer. Non-catalog hangers available in Hot-dip galvanized, use HDG after product number.

Factored Resistance: For multiple options for the same connector, use the most conservative reduction to give the lowest design load.

Installation:

- Fill all nail holes with fasteners specified in the tables.
- Fastener quantities may increase from the amount listed in the tables depending on hanger option.
- NA16D-RS and NA20D nails are supplied with hangers.
- For type A skewed hangers, the end of joist must be bevel cut; for type B skewed hangers, the end of joist must be square cut.

Codes: Modified hangers are not code evaluated due to their numerous variations.

See the Specialty Options Chart for each hanger series for load reductions and hanger maximum range of skew, slope, etc.

Skewed Hanger:

- Consider SKH or SKHH hangers for 45° skews.
- Joist nails on the closed side may be relocated to the open side to ensure proper nailing.
- Specify skew angle, type (square cut or bevel cut), and direction when ordering.

Typical SUH hanger skewed, right shown (bevel cut)

Typical SUH formed hanger skewed, right shown (square cut)

Sloped Seat Hanger:

- Consider LSSH series for sloped applications.
- Additional nail holes may be added to joist flanges.
- Specify slope angle and direction when ordering.

Sloped/Skewed Hanger:

- See nailing notes for both skewed and sloped hangers.
- Specify skew and slope angles as well as skew/slope directions and skew type (square cut or bevel cut) when ordering.

Typical HD hanger sloped seat, down shown

Typical HD hanger sloped down, skewed left shown

Inverted Flange Hanger:

- When nailing into the carrying member's end grain, the factored resistance is 0.65 of the table load.
- Hangers with one flange inverted achieve 100% of listed table load.
- Specify right or left flange when inverting only one flange.

Typical GHF hanger one flange inverted, left shown

Typical HD hanger inverted flange

OPEN TOP FLANGE HANGER SPECIALTY DETAILS

See Specialty Options Chart for each hanger series for load reductions and hanger maximum range of skew, slope, etc.

Skewed Hanger:

- Joist nails may be located on obtuse side to ensure proper nailing.
- Specify skew angle, type (square cut or bevel cut), and direction when ordering.

Sloped Seat Hanger:

- Additional nail holes may be added to joist flanges.
- Specify slope angle, direction, and joist height when ordering.

Sloped/Skewed Hanger:

- See nailing notes for both skewed and sloped hangers.
- Specify skew and slope angles as well as skew/slope directions, and skew type (square cut or bevel cut) when ordering.
- Similar to face mount skewed/sloped hanger, refer to illustration on page 221: Typical HD hanger sloped down, skewed left shown.
- Specify if hanger is to be high side flush, low side flush, or center flush.

Sloped/Skewed/Sloped Top Flange Hanger:

- See nailing notes for both skewed and sloped hangers.
- Specify skew, slope, and top flange slope angles as well as skew/slope and top flange slope directions when ordering.
- Hangers may be galvanized or painted.
- Hangers may be made with solid top flange.

Typical BPH hanger skewed, left shown (bevel cut)

Typical HDO hanger skewed, right shown (square cut)

Typical BPH hanger sloped seat, down shown

Typical BPH hanger sloped down, skewed right, high side flush shown

Typical BPH hanger skewed right, sloped down, top flange sloped

Typical BPH hanger sloped top flange right shown (this configuration will not be open back)

SOLID TOP FLANGE HANGER SPECIALTY DETAILS

See Specialty Options Chart for each hanger series for load reductions and hanger maximum range of skew, slope, etc.

Skewed Hanger:

- Joist nails may be located on obtuse side to ensure proper nailing.
- Specify skew angle, type (square cut or bevel cut), and direction when ordering.

Sloped Seat Hanger:

- Additional nail holes may be added to joist flanges.
- Specify slope angle, direction, and joist height when ordering.

Sloped/Skewed Hanger:

- See nailing notes for both skewed and sloped hangers.
- Specify skew and slope angles as well as skew/slope directions, and skew type (square cut or bevel cut) when ordering.
- Specify if hanger is to be high side flush, low side flush, or center flush.

Typical PHXU hanger skewed, left shown (bevel cut)

Typical PHXU hanger skewed, left shown (square cut)

Sloped Top Flange Hanger:

- Additional nail holes may be added to top angle.
- Specify top flange slope and direction when ordering.
- Specify if hanger is to be high side flush, low side flush, or center flush.

Ridge Hanger:

- Specify flush top of beam at center, right side, or left side.
- Specify angle of slope when ordering.

Top Flange Offset Hanger:

- Specify offset, left (L) or right (R), when ordering.

Saddle Hanger:

- Specify saddle width, "SA" when ordering. Allow clearance for saddled member.

PART NUMBER SYSTEM

Part Numbers assigned to TFL, THO, and THF I-Joist hangers reveal the I-Joist sizes to be used with the specific hanger. This guide will teach you how to recognize I-Joist dimensions in the part numbers.

1st, 3rd, and sometimes 4th digits are whole numbers
(This example denotes 2 and 11)
4th digit may be part of a decimal –

TFL 23118

2nd and 5th digits are decimals
(see guide below)

(This example denotes .3125

[5/16] and .875 [7/8])

5th digit may be (0) or dropped if height is even

Part Number Guide for Decimals

1 = .125	or	1/8 inch
2 or 25 = .25	or	1/4 inch
3 = .3125	or	5/16 inch
5 = .5	or	1/2 inch
6 = .625	or	5/8 inch
7 = .75	or	3/4 inch
8 = .875	or	7/8 inch

TH035925-2

TH0

Letters refer to Hanger Series
ex.: TH0

35

First (2) Digits refer to Member Width
ex.: 3.5 inches

925

Last (2) or (3) Digits refer to Member Height
ex.: 9.25 inches

-2

Digits after Dash refer to Number of Plys
ex.: 2 ply

Some Examples:

TH015950 1-1/2" x 9-1/2"

THF17925 1-3/4" x 9-1/4"

TH016925-2 double 1-5/8" x 9-1/4"

THF23140-2 double 2-5/16" x 14"

Note: USP's Product Catalog lists a range of heights for THF hangers. Face mount hangers can usually accommodate more than one I-Joist height. The hanger height must be tall enough to support the top chord of the I-Joist to eliminate web stiffener requirements for lateral support. The THF hanger must be a minimum of 60% of the joist height.

Hardy Frame is the industry leading pre-fabricated shear wall system. Building Design Professionals specify the Hardy Frame System not only to resist wind and earthquake loads but to also maximize wall openings economically.

The Hardy Frame product line includes Panels, Brace Frames and Accessories.

Hardy Frame[®]

HFX-Series Panels

- Panels are available in 9, 12, 15, 18, 21 and 24 inch widths
- Standard Heights range from 78 inches for portal applications to 20 feet for Balloon Walls
- Custom heights are manufactured routinely
- With proper detailing and anchorage "Back to Back" installations provide two times the factored shear value without increasing the wall width

Hardy Frame[®]

HFX-Series Brace Frames

- Brace Frames are available in 32 and 44 inch widths
- Standard Heights range from nominal 8 to 13 feet
- Custom heights are manufactured routinely
- For a given shear load, installing a wider shear wall results in reduced overturning

Template Kit (HFXTK & HFXTK-HS)

Includes:

- One Template for accurate anchor spacing and alignment
- One Bolt Brace for installation at embed end of anchors to prevent independent sway while pouring concrete
- Two 1-1/8 inch diameter hold down anchors
- Six Grade 8 hex nuts
- Two hardened round washers
- Two 1/2" x 3" x 3" plate washers are included when high strength (HS) anchors are specified

Hardy Frame[®]

Bearing Plate (HFXBP)

- 3/4" thick x 3-1/2" wide ASTM A36 steel
- Length extends 3" beyond Panel edges. **Check for outside corner conditions!**

- Reduces wood deformation from overturning forces
- Reduces effects of shrinkage by eliminating bottom plate

Note: The allowable values in raised floor and upper floor tables assume installation of HFXBP. Installation without a HFXBP may result in a reduction of allowable loads.

Z4 Tie-Down Systems utilize Z4 CNX-Series Cinch Nuts to compensate for wood shrinkage and building settlement that cause connections to loosen over time. The Cinch Nut uses a self-ratcheting action that permits movement or an internal “travel” perpetually in one direction along the length of a threaded rod. Cinch nuts are available for installation with threaded rods that are 3/8 inch through 1-1/2 inch diameter in 1/8 inch increments.

- Place the specified Bearing Plate Washer onto the bottom plate of a wood framed wall.
- With the “wings” oriented downward, place Cinch Nut over the Z-Rod extending from below and push down until it seats firmly on the Bearing Plate Washer.
- Install 1/4 inch diameter USP WS-Series screws through the wings, penetrating 1-1/2 inches (minimum) into the wood bottom plate.
- Model numbers BPW5 and BPW6 fit in-between the screws fastening the wings.
- Model numbers BPW7 (3-1/4 x 4-3/8) and larger are provided with two screw holes. Align the wing and the Bearing Plate Washer screw holes to allow installation of 1/4 inch diameter WS-Series screws.

BPW7 and larger installation

INSTALLATION

Z4 Tie-Down System for Lateral Loads

To resist tension loads due to overturning moments in multi-story buildings the CNX Cinch Nut is installed over a Bearing Plate Washer at each level in a fast and easy application. At the upper-most level a Cinch Nut is installed over a Bearing Plate Washer above the top plates. At walls below that bear on wood floor systems, the Cinch Nut and Bearing Plate Washer are installed over the bottom plate. Tension loads are gathered at each level and transferred into the foundation through a continuous system of Cinch Nuts, Bearing Plate Washers, Z-Rods/ATRs and Couplers all available from **MiTek® Builder Products**.

For Lateral Loads

Z4 Tie-Down System for Wind Uplift

For resisting roof uplift loads resulting from wind the Z4 Cinch Nut is installed over a Bearing Plate Washer above the top plates with roof framing above to create a tie-down system. Uplift forces are transferred into a continuous system of Z-Rods / ATRs and Couplers that form a load path to the foundation.

For Wind Uplift Loads

Let our reliability carry your load.

At MiTek, our knowledge and experience is integrated into every product we manufacture. Each product is engineered, tested, analyzed and retested to provide the most efficient design to safely support structural loads.

Our professional engineers, drafters and test lab technicians are united in creating innovative solutions to challenges, old and new. When you specify and use USP connectors, you can be confident you're getting products thoughtfully designed and rigorously tested to meet the latest code requirements.

USP engineers provide support to all involved in the building industry. To contact an engineer:

Made in North America. Designed to Last.

USP Structural Connectors are manufactured and distributed in 8 strategic locations in North America. We are proud of our quality products and the service we offer our valued customers.
